CS18LV20483

GENERAL DESCRIPTION

The CS18LV20483 is a high performance, high speed, and super low power CMOS Static Random Access Memory organized as 262,144 words by 8 bits and operates from a wide range of 2.7 to 3.6V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.50uA and maximum access time of 55/70ns in 3.0V operation. Easy memory expansion is provided by an active LOW chip enable inputs (/CE1, CE2) and active LOW output enable (/OE) and three-state output drivers.

The CS18LV20483 has an automatic power down feature, reducing the power consumption significantly when chip is deselected. The CS18LV20483 is available in JEDEC standard 32-pin sTSOP 1 -8x13.4 mm, TSOP 1 -8x20 mm, TSOP 2 -400 mil; SOP -450 mil.

FEATURES

- Low operation voltage: 2.7 ~ 3.6V
- Ultra-low power consumption :
 - 2mA@1MHz (Max.) operating current
 - 0.50 uA (Typ.) CMOS standby current
- High speed access time: 55/70ns (Max.) at $V_{CC}= 3.0V$.
- Automatic power down when chip is deselected.
- Three state outputs and TTL compatible
- Data retention supplies voltage as low as 1.5V.
- Easy expansion with /CE and /OE options.

PIN DESCRIPTIONS

Name	Type	Function
A0 – A17	Input	Address inputs for selecting one of the 262,144 x 8 bit words in the RAM
/CE1, CE2	Input	/CE1 is active LOW and CE2 is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and in a standby power down mode. The DQ pins will be in high impedance state when the device is deselected.
/WE	Input	The Write enable input is active LOW. It controls read and write operations. With the chip selected, when /WE is HIGH and /OE is LOW, output data will be present on the DQ pins, when /WE is LOW, the data present on the DQ pins will be written into the selected memory location.
/OE	Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when /OE is inactive.
DQ0~DQ7	I/O	These 8 bi-directional ports are used to read data from or write data into the RAM.
V _{CC}	Power	Power Supply
Gnd	Power	Ground
NC		No connection

NOTES:

1. A write occurs during the overlap (t_{WP}) of low /CE1, a high CE2 and low /WE. A write begins when /CE1 goes low, CE2 going high and /WE goes low. A write ends at the earliest transition when /CE1 goes high, CE2 goes high and /WE goes high. The t_{WP} is measured from the beginning of the write to the end of write.
2. t_{CW} is measured from the /CE1 going low or CE2 going low to end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as /CE1 or /WE going high or CE2 going low.
