# 1. Foreword

Thank you for choosing this Inverter which has an outstanding performance and is manufactured by TECORP ELECTRONIC., LTD from Taiwan.

For full extending, this inverter function and ensuring user's safety, please carefully read these instructions. If you have any questions, please contact us or our agent in you local place, we are glad to service you and please continually support TECORP products.

## Safety Precautions

For your safety concern, please pay attention to the symbol "danger" and "warning" before starting running, installation, and during inverter inspection. Please follow these safety instructions, and thanks for your cooperation.

 **Danger:** Misuse may cause fire, severe injury, even death.

 **Warning:** Misuse may cause medium or minor injury and equipment damage.

Danger
<ul style="list-style-type: none"><li>• After turning off power and before the indicator light has turned off, please do not touch the circuit board and components.</li><li>• Please do not adjust the wiring during power inputting, and not open the circuit board and components during product running.</li><li>• Please do not change the components inside on product without the instruction from Manufacturer.</li></ul>

Warning
<ul style="list-style-type: none"><li>• Please do not make any abnormal testing to the product or components inside of it.</li><li>• Please do not connect the output terminal U.V.W with AC power supply.</li><li>• Please do not touch the circuit board in order to prevent it from static electricity injury.</li></ul>

## 2. Products Inspection

Each TECORP product has passed quality and function testing before leaving the factory. After taking off its packing, please follow the steps below to check first:

- Please check the inverter model and capacity is the same as you ordered.
- If the inverter sustains any serious damage during shipping delivery, please do not input power or turn on the product.

※ If you have any problems as mentioned above, please contact TECORP Company or our local agent soon, thanks for your cooperation.

### 2.1 Model Description

Take three phas AC 380V 11KW as an example, below is it detail.

Inverter model name→MODEL: VG5-4011  
 Input power spec→INTPUT: AC3PH 380V~460V 50/60HZ  
 Power→CAPACITY: 11KW(15HP)  
 Output spec→OUTPUT: 0~460V 0~400HZ 27A 21KVA  
 Serial Number→S/NO.: 100223  
 TECORP TECHNOLOGY CO,LTD

Model Name Description

## 2.2 Inverter Outline

### Product weight list

VG5 /VG2 200V Weight																			
KW	1.5	2.2	3.7	5.5	7.5	11	15	18.5	22	30	37	45	55	75	90	110	132	160	200

## 2.3 Specification

	Specification	VG5	VG2
Control Character	Control Mode	Current vector sine wave PWM	
	Start Torque	150%/1Hz (150%/0rpm with PG)	150%/1Hz
	Speed Control Range	1:100 (1:1000 in case of PG)	1:100
	Speed Control Accuracy	±0.2% (25°C~10°C). (0.02%) with PG	±0.2% (25°C~10°C). (0.02%)
	Speed Response	5Hz (30Hz with PG) <sup>2</sup>	5Hz
	Torque Limit	Yes (four quadrant)	Yes (two quadrant)
	Torque Accuracy	±5%	Without torque control function
	Frequency Control Range	0.1~400Hz	0.1~400Hz
	Frequency Accuracy (Temperature Fluctuation)	Digital command ±0.01% (10°C~+40°C)	Analog command ±0.01% (25°C~+10°C)
	Frequency Setting Resolution	Digital command 0.01Hz, analog command 0.03Hz/60Hz (11bit +symbol)	
	Output Frequency Resolution (Calculation)	0.001Hz	0.001Hz
	Overload Capacity	150% of rated output current, 1 min	120% of rated output current, 1 min
	Frequency Setting Signal	Analog 10~10V, 0~10V, 4~20mA	Analog 10~10V, 0~10V, 4~20mA
	Acceleration and Deceleration Time	0.01~6000 sec. (individual setting of acceleration and deceleration... 4 switches)	
Braking Torque	About 20%	About 20%	
Protection Function	Motor Protection	Electronic thermal protection	Electronic thermal protection
	Prompt Over Current	Protection for 200% of the rated output current	Protection for over 160% of the rated output current
	Fuse Protection	Protection by fast fusing instrument	Protection by fast fusing instrument
	Overload	150% of the rated output current, 1 min.	120% of the rated output current, 1 min.

## Chapter 2 Products Inspection

	Specification	VG5	VG2
Protection Function	Over Voltage Protection	Stop above 820V of the main circuit voltage	
	Low Voltage Protection	Stop below 380V of the main circuit voltage (adjust by parameter setting)	
	Prompt Power Failure Compensation	Stop by operation mode in more than 15ms, Continue running after recovering in 2 seconds.	
	Overheat	Protected by thermistor	Protected by thermistor
	Stall Prevention	Prevent from stalling in acceleration and deceleration	
	Grounding Protection	Electronic circuit protection (over-current level)	
	Charge Indication	Indication falling to 50V of DC voltage of main circuit	
Environment	Ambient Temperature	Closed wall mount type 10°C~+40°C, cabinet installed type 10°C~+45°C	
	Humidity	Less than 90%RH	Less than 90%RH
	Storage Temperature	20°C~60°C	20°C~60°C
	Application Site	Indoors (without corrosive gas and dust)	Indoors (without corrosive gas and dust)
	Altitude	Less than 1000m	Less than 1000m
	Vibration	10~20Hz less than 9.8m/s(1G), 20~50 less than 2m/s(0.2G)	
General Function	ProfiBus Communication	Yes(option)	No
	DeviceNET Communication	Yes(option)	No
	RS485 Communication	Yes	Yes
	PG Vector Control	Yes	No
	PID Function	Yes	Yes
	Zero-Serve Function	Yes	No
	Speed Limit for Torque Control	Yes	No

## 3. Installation

Environment for product installation

The environment of product installation has direct influence on the product life time and its performance.

Therefore, the condition of product installation should fit with the following requirements.

- Environment temperature: Cabinet type (-10~45°C/+14~113°F)  
Wall hang type (-10°C~40°C/+14~104°F)
- To prevent water droplets pouring rain or humid environment
- Avoid direct sunlight
- Prevent oil dew, water erosion
- To prevent the corrosive liquids, gas•
- To prevent dust, cotton and metal fine dust intrusion
- Radioactive substances and combustible materials away from the product
- To prevent electromagnetic interference (welding machine, power machinery)
- Prevent vibration (punch) can not be avoided, if requested to install anti-vibration pads to reduce vibration.
- When installing inverter inside of control panel, Please pay attention to its location ie. Where would be best for a cooling effect. Basically, the surrounding temperature should be under 45 degrees; otherwise, please install extra heat sink (fan) to maintain this temperature.

Please ensure the front side of inverter is face up for radiation

## Chapter 3 Installations

	Surrounding temperature	Surrounding humidity
Cabinet type	-10 ~ +45°C	90% relative (non-dew)
Wall hang type	-10 ~ +40°C	90% relative (non-dew)

•Installation space must meet the following requirements:

A. Room between left and right side

B. Room upper and bottom side

VG5/VG2 installation room and direction

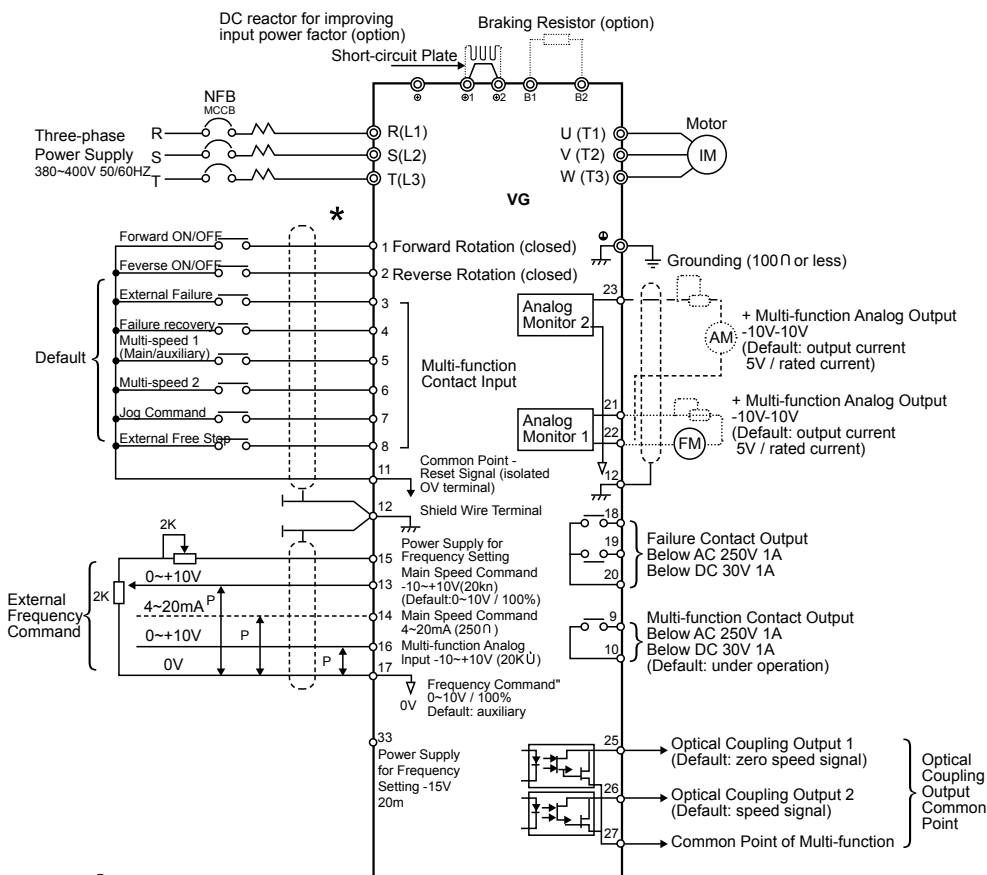

## 4. Wiring

The inverter should all equip with terminal diagram, please find the detail below, and pay attention to the terminal part number.

11	12(G)	13	14	15	16	17	25	26	27	33	18	19	20
1	2	3	4	5	6	7	8	21	22	23	9	10	

### 4.1 Wiring:

According to the wiring diagram below, the digital panel only needs to use main circuit to operate. R.S.T (power input), U.V.W (motor output)

- Note 1:  shielded wire  Isolated wire
- 2: Terminal 15,33 rated Output +15V, -15V, 20mA.
  - 3: Terminal 13, 14 can not be used simultaneously, when using ad the same time its frequency command will be added together.
  - 4: The multi-functional analog output is for extra frequency / current direction usage. Please do not use it as close-loop circuit system. This control system can add an interface card.

### 4.2 Description of terminal function:

- Main loop terminals and description

Terminal	Functions
R	The main circuit power input terminal
S	
T	
U	inverter output terminal
V	
W	
P	Brake unit connect terminal
N	
E	Ground terminal (The third grounding in particular)

### 4.3 Description of control circuit terminal function

Signal	NO.	Name	Terminal function	Signal Location
Running Output signal	1	Forward / Stop	Close → Forward, Open → Stop	DC24V, 8MA Light through close insulation
	2	Reverse / stop	Close → Reversal, Open → Stop	

Signal	NO.	Name	Terminal function		Signal Location
Running Output signal	3	External abnormal input	Close → Error, Open → Normal		DC24V, 8MA Light through close insulation
	4	Abnormal return	Close → Return		
	5	Main-speed auxiliary switch	Close → Auxiliary frequency instructions		
	6	Multi-function command 2	Close → multi-speed command 2 effective		
	7	Jog command	Close → Jog running		
	8	External to suspend operations	Close → Inverter stop output		
	11	1 ~ 8 joints	With the short-circuit signal input terminal 1-8		
Analogy Input signal	15	Speed command power +15 V	Instruction set power terminal velocity, + 15V power		+15V, 20MA
	33	Speed command power -15 V	Instruction set power terminal velocity, -15V power		-15V, 20MA
	13	Main speed frequency command	0-10V/100% Frequency -10 ~+10 V/-100% - +100% Frequency		H3: 01-03 H3: 08-10 0~10V (20K ohms) -10 ~ +10 V (20K ohms) 4-20MA (250 ohms)
	14		4-20MA/100% Frequency		
16	Auxiliary frequency command	0-10V/100% Frequency -10 - +10 V/-100% - +100% Frequency		Auxiliary analog input H3-05 0-10V (20K ohms) 4-20MA (250 ohms)	

## Chapter 4 Wiring

Signal	NO.	Name	Terminal function		Signal Location	
Analogy Input signal	17	Joint	Joint of terminal 13, 14 speed command		-	
	12	Shielding wire terminals	Shelter stranded terminal		-	
The Control Output signals	9	Signal operation	Conduction terminal at running	Multi-function signal output H2-01-03	Contact AC250V.1A DC30V .1A	
	10	Output (1A contact)				
	25	Zero speed detection	Lower than the lowest frequency B2-01 is close		Open collector output 48V, 50MA following	
	26	Speed reach detection	Setting frequency $\pm 2\text{HZ}$ as LOW			
	27	Joint of terminal 25, 26				
	18	Abnormal output signal	In abnormality: terminals 18-20 close terminal 19-20 open			Contact AC250V 1A DC30V 1A
	19	A contact				
	20	B-contact				
Analog output	21	Frequency meter output	0-10V/100% Frequency	Multi-function analog output 1 (H4-01, H4-02)  function2 (H4-04, H4-05)	f0-10V MAX+-5% 20MA low	
	22	Joint				
	23	Output current monitoring	5V / inverter rated current			

## 4.4 Notice of applications and accessories:

- ◆ **Power:**
  - Please make sure the voltage level, to avoid damage happening.
  - It is necessary to install non-fuse breaker between the inverter and AC power.
- ◆ **Non-fuse breaker:**
  - Please choose the non-fuse breaker conforms to the rated voltage and power level of inverter for ON/OFF control and protection.
  - The non-fuse breaker should not operate the run/stop switch function as the inverter.
- ◆ **Leakage circuit breaker:**
  - Please install leakage circuit breakers, to prevent from leaking and protect personnel safety.
- ◆ **Electromagnetic Contactor:**
  - General usage will not require installation of the electromagnetic contactor. But for external control, or restart function when power-off, and the brake controller, an electromagnetic contactor is required.
  - Magnetic Contactor can not operate the run/stop switch function as the inverter
- ◆ **AC reactor for power improvement:**
  - Below the 15KW 400V/220V inverter, when inputting big power Capacity (more than 600KVA). It is helpful to install the AC reactor for improving its functions.
- ◆ **Input side noise filter:**
  - It is necessary to install it when inductance loads surround the inverter.
- ◆ **Inverter:**
  - The power input terminal R.S.T without phase-sequence can change its phase connection.
  - The output terminal U.V.W. connects with the U.V.W. terminal of motor. When the motor is reverse running, only need to exchange two phases of U.V.W. terminals.
  - Input terminal U.V.W cannot connect with AC power
  - Ground terminal requests properly grounded, 200V Class third grounding. / 400V Class Special ground level.
- ◆ **Output side noise filter:**
  - Reduce the inverter if high harmonic wave problem occur, in order to avoid affecting the nearby communications equipment
- ◆ **Motor**
  - Please use the induction motor for three phase capacity
  - If an inverter drives multi-motors, please consider motor capacity and the current operation must be less than inverter's
  - Do not install the capacitance between the inverter and motor.
  - Inverter and motor must be grounded separately.

For the external wiring, please follow the below steps. After finished wiring please make sure it is correct. (Do not use control loop buzzer to check the wiring)

(A) The main power circuit wiring must keep a distance and away from other high voltage or power lines in order to avoid noise interference. Please find the following details:

- Main circuit output terminal install the filter can restrain the noise. In order to avoid radiation noise, please install metal tub on the wiring line and keep distance with other machines more than 30 CM.

The description of VG5 / VG2 Braking Resistor selection

Inveter		Braking Unit		Braking Resistor		Braking Torque (10% ED)
Voltage Level	Applicable Motor HP (KW)	CDBR-	Number	Watt Value	Number	
200V ~ 230V	2(1.5)	*		260W100Ω	1	125
	3(2.2)	*		260W70Ω	1	120
	5(3.7)	*		390W40Ω	1	125
	7.5(5.5)	*		520W30Ω	1	115
	10(7.5)	*		780W20Ω	1	125
	15(11)	2015	1	2400W13.6Ω	1	125
	20(15)	2015	1	3000W10Ω	1	125
	25(18.5)	2022	1	4800W8Ω	1	125
	30(22)	2022	1	4800W6.8Ω	1	125
	40(30)	2015	2	3000W10Ω	2	125
	50(37)	2015	2	3000W10Ω	2	100
	60(45)	2022	2	4800W6.8Ω	2	120
	75(55)	2022	2	4800W6.8Ω	2	100
	100(75)	2110	1	4800W6.8Ω	3	110
	125(90)	2110	1	4800W6.8Ω	4	120
150(110)	2110	1	4800W6.8Ω	5	100	

Inverter		Braking Unit		Braking Resistor		Braking Torque (10% ED)
Voltage Level	Applicable Motor HP (KW)	CDBR-	Number	Watt Value	Number	
380 ~ 460V	2(1.5)	*		260W400Ω	1	125
	3(2.2)	*		260W250Ω	1	135
	5(3.7)	*		390W150Ω	1	135
	7.5(5.5)	*		520W100Ω	1	135
	10(7.5)	*		780W75Ω	1	130
	15(11)	*		1040W50Ω	1	135
	20(15)	*		1560W40Ω	1	125
	25(18.5)	4030	1	4800W32Ω	1	125
	30(22)	4030	1	4800W27.2Ω	1	125
	40(30)	4030	1	6000W20Ω	1	125
	50(37)	4045	1	9600W16Ω	1	125
	60(45)	4045	1	9600W13.6Ω	1	125
	75(55)	4030	2	6000W20Ω	2	135
	100(75)	4045	2	9600W13.6Ω	2	145
	125(90)	4045	2	9600W13.6Ω	2	120
	150(110)	4220	1	6000W20Ω	3	100
	175(132)	4220	1	9600W13.6Ω	4	150
	200(160)	4220	1	9600W13.6Ω	4	140
	250(185)	4220	1	9600W13.6Ω	4	120
	300(220)	4220	1	9600W16Ω	5	125
320(250)	4220	1	9600W16Ω	5	90	
400(315)	4220	2	9600W16Ω	6	110	

If the wiring distance between the inverter and motor is too long, please consider the voltage drop between lines, the voltage drop (V) with appropriate =  $\sqrt{3}X$

Line resistance (Ω/km) x line length (m) x current  $X10^{-3}$  and must be in accordance with carrier number. Distance wiring

The inverter and the motor wiring distance	50M below	100M below	More than 100M
Allowable carrier wave	15KHZ below	10KHZ below	5KHZ below
Parameters C6-01	15.0	10.0	5.0

(B) Control loop wiring has to be away from the main circuit control lines or other high voltage or power lines. In order to avoid the noise interference problem happening.

- Control loop wiring terminal 9, 10, 18, 19, 20 (output point) must be separated from other terminal wiring.
- To prevent noise interference result in incorrect running problem happening. The control circuit wiring has to use the Shielded cable. Please refer to the wiring diagram as below shows, and the distance should not exceed 50 meters.

(C) inverter's grounding terminal, be sure to be properly grounded, 220V-class third grounding, 440V-class special grounding.

- Grounding electrical equipment wiring to technical benchmarks (AWG) subject to the earth wire, the shorter the better.
- inverter's grounding wire must not be with the other high current loads (such as welding machines, high-powered motors) common ground must be separately grounded.
- the number of inverters of common ground, do not form a ground loop.

(D) Wiring specification, the main power circuit and control circuit wiring of the diameter size of the selected request in accordance with the provisions of wiring electrician Act, to ensure safety.

(E) After completed wiring, please to make sure the wiring is correct connection, whether the cable is damaged or not, and screw terminals are tighten or not.

## 5. Trial running

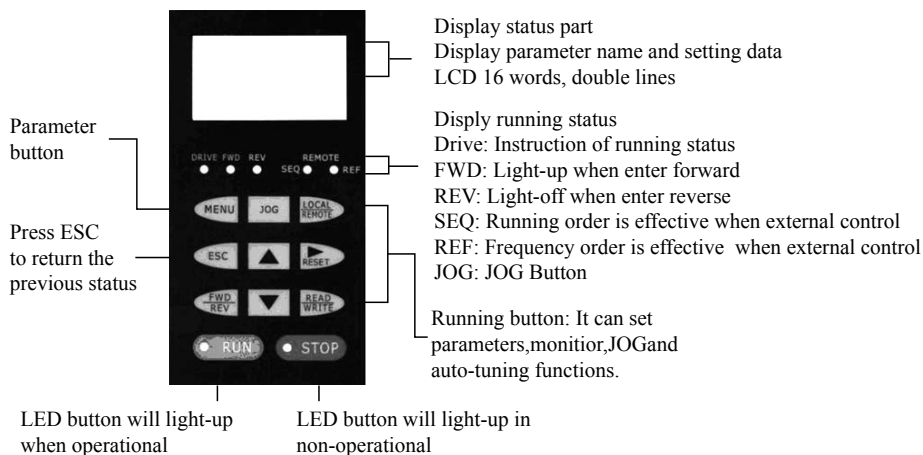

### 5.1 The inspection before running

#### (A) Power input before the examination

- Main circuit wiring is correct?
- Terminal screws tightened?
- Whether or wire breakage caused by improper wiring short circuit?
- Load condition normal?

### 5.2 Running Test

- Make sure before the power input that the voltage level before and wiring are correct.
- After the power input if abnormal sound, smoke, or smell when you cut off the power generated.
- Power input in the display of digital manipulator is as follows:

The test the running safety:

Danger
<ul style="list-style-type: none"> <li>• Do not take off the front cover during power sending, to prevent personnel got hurt.</li> <li>• With auto-restart setting function; the motor will start running after stopped run. Please keep away from the machine for dangers.</li> <li>• The STOP switches will effective after set its functions. It's different than emergent STOP switches. Please pay attention on it.</li> </ul>

Warning
<ul style="list-style-type: none"> <li>• Cooling seat, brake resistors such heating components please do not touch.</li> <li>• Inverter can be easily changed speed from low to high operation, verify the allowable range of motors and machinery.</li> <li>• When using the brake resistor please make sure all related settings.</li> <li>• Do not check the signal of board when the inverter under running.</li> <li>• Since the inverter had adjusted the setting before left the factory, please do not randomly change.</li> </ul>

Running mode selection:

Inverter running mode has two types: LOCAL and REMOTE. Factory setting is REMOTE (control circuit terminal order is effective), the parameter content please see the following shows:

LOCAL: Frequency and Running command will mainly be set by the running panel. At this time SEQ and REF will lights off.

REMOTE: Frequency and Running command will mainly be set by the external terminal. At this time SEQ and REF will lights up.

Code	Display	Name	Frequency Command	REF LED	SEQ LED
B1-01	Reference Source	Frequency command selection	0: Frequency command set by running panel (D1-01) 1: Frequency command set by external terminal 13.14 2: Frequency command set by the communication delivering 3: Frequency command set by the interface card	OFF ON Scintillation Scintillatio	/

Code	Display	Name	Frequency Command	REF LED	SEQ LED
B1-02	Run Source	Running instruction selection	0: Running command set by running panel 1: Running command set by external terminal 2: Running command set by the communication delivering 3: Running command set by the interface card	/	OFF ON Scintillation Scintillation

### 5.3 The setting before start running

Please test the running when the motor without loads situation, in order to prevent incorrect process happening to damage the machinery. If it's necessary to test with loads, please pay attention on the machinery and personnel safety.

#### ◆ Checking Notice when running:

When running please check the followings are normal working.

- Motor run is smooth.
- Motor running direction is normal.
- Whether there are abnormal motor vibrations.
- Accelerations, decelerations running are smooth.
- The current load is under rated range.
- The light of running panel is normally display.

#### (A) Using digital manipulator Test Run

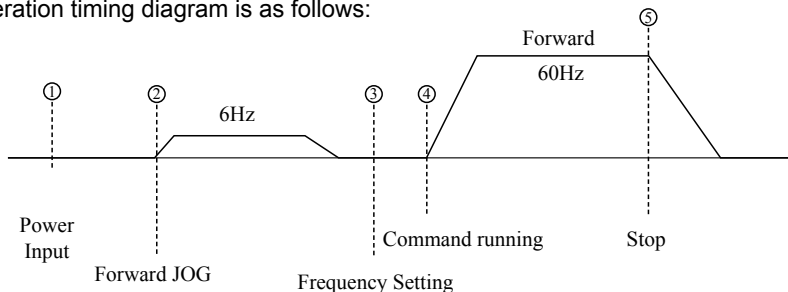

## Chapter 5 Trial Running

Steps	Key Operation	Display
Power input - Frequency value instructions	<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;">LOCAL REMOTE</div>	<div style="border: 1px solid black; border-radius: 10px; padding: 5px; width: fit-content; margin: 0 auto;">Frequency Ref U1-01=00.00HZ</div> <p><b>REMOTE LED(SEQ, REF) flash</b></p>
Operation mode setting - LOCAL mode of operation	<div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;">JOG</div>	<div style="border: 1px solid black; border-radius: 10px; padding: 5px; width: fit-content; margin: 0 auto;">Frequency Ref U1-01=00.00HZ</div>

(B) The external terminal signal test operation

Operation timing diagram is as follows:

Steps	Key Operation	Display
Power input: - Frequency value instruction		Frequency Ref U1-01=00.00HZ
Operation condition setting - Select Remote mode to display output	LOCAL REMOTE  ▲	REMOTE LED (SEQREF) lights Output Freq U1-02=00.00HZ
Frequency - Output frequency monitoring		Output Freq U1-02=6.00HZ
Forward / inching operation - Control Terminal of 7-11 first, and then ON - When terminal 1-11 ON and inching is OFF, stop.	▼  ▲	FWD LED lights RUN Frequency Ref U1-01=60.00HZ
Frequency number setting: - Control terminal 13 or 14 send out voltage or current signals to change the display of frequency value		Frequency of inputting 10V to Terminal 13 Output Freq U1-02=00.00HZ
Output frequency monitoring		Output Freq U1-02=6.00HZ
Operation command input - When control terminal 1-11 is ON, running forward with 60HZ.		RUN FWD Light-up RUN
Stop - When control terminal 1-11 is OFF, decelerate to stop.		Output Freq U1-02=0.00HZ RUN LED is flashing in deceleration SROP

### 5.4 Application Examples

This module describes the various functions and Inverter applications

Function name	Applications	Purpose	Description	Related
3-wire	General occasion	Running with the PB implementation, stop, control one contact	The following diagram shows the wiring control inverter: start, stop, forward/reverse operation.	A1 – 03 H1 – 01
Operation Signal Selection	General occasion	Select control signal source	Select frequency Inverter controlled by an external terminal or by a digital device manipulator	B1–01,02 H1–01~06
Carrier frequency	General occasion	Reduce noise	Adjust the Inverter carrier frequency to reduce the noise of motor caused by metal.	C6-01-03
Load rotational speed	General occasion	Show running frequency	Motor speed (rpm), mechanical speed (rpm) mechanical speed (m / min) shown on the digital manipulator	01–03
Operation Output	General occasion Mechanical brake	Running Signals	Motor Inverter operation sent a signal to release mechanical brake, (free-running frequency Inverter stops, the signal disappears)	H2–01~03
At zero velocity Signal output	General occasion Machine tool	Running Signals	Inverter output frequency is below the minimum output frequency, sending a signal to provide an external system or control circuit to use.	
Speed reach signal output	General occasion Machine tool	Running Signals	Inverter output frequency reaches the set frequency, sending a signal to provide an external system or control circuit to use.	

Function name	Applications	Purpose	Description	Related
After the torque signal output	Machine tool Fan to help Extruder	Protection to enhance reliability of loading and unloading operation	The motor occurred torque which is beyond the Inverter setting, sending a signal to prevent mechanical damage to the load.	H2-01~03
Frequency of operation of upper and lower limits	Pump Fan	Control the motor speed within the upper and lower limits	External operation signals can not provide upper and lower limits, gain, bias; they can adjust the individual settings within the inverter.	D2-01~02
Set against the frequency command	Pump Fan	Prevent mechanical vibration	When prohibit frequency setting; the Inverter can not operate to the regular speed within prohibit frequency. Against frequency can be set to three groups.	D3-01~04
Low Voltage Output	general occasion	Running condition Signals	Converter-side P-N terminal voltage, after the detection of low voltage, sending a signal to provide external systems and control circuit to use.	H2-01~03
Maintaining Frequency Operation	general occasion	Acceleration and deceleration Suspension	Maintain the output frequency in Inverter acceleration and deceleration.	H1-01~06
Abnormal automatic restart	air-conditioner	Ascension movement continuity and reliability	After inverter abnormal failure is detected, abnormal failure disappears and the inverter reset and start automatically, the start frequency can be set to 10 times.	L5-01
Dc brake urgent stop	High-speed shaft	No brake resistor installed, motor stop rapidly	When inverter braking resistance and brakes are not installed and torque is in shortage, dc brakes can be used to stop motor urgently. (Decelerating cycle no more than 5%, brake torque, use of 50-70%)	B1-03 B2-01~04

## Chapter 5 Trial Running

Function name	Applications	Purpose	Description	Related
Overtorque setting	Pump Fan Extruder	Protect machine and enhance operation continuity and reliability	Detection level of the motor or machinery torque overtorque can be set for the Inverter to adjust the output frequency when the overtorque occurred. Applicable to the wind power and hydraulic machinery without tripping operation.	L3-01-06 L6-01-06
When frequency instruction stops, keep running.	air-conditioner	Enhance the operation Continuity	Control system fault frequency instruction ends, inverter can continue to run. Applicable to intelligent building air-conditioning equipment.	L4-05
Speed searching	Windmill, winding equipment and inertia loads	Motor restart in free operation	Before the free-running motor stops, the motor can restart without detecting the speed; the inverter automatically tracks the speed, and then speed up after the speed is consistent.	B3-01-03
The pre-operational DC brake	Windmill, pump, and stop when the load is still turning	Motor restart in free operation	If the running direction of free-running motor is changeable, implement the DC braking before the motor start running.	B2-01-03
Converter Commercial power switching and running	Windmill, explain the movable load when stop	Converter Commercial power switching	Inverter and commercial power switching operation without stopping motors, or heavy load starts through commercial power, and the inverter runs with variable speed.	H1-01-06
Energy efficient Operation	Press, Precision Work Machinery.	Energy efficient Reduce vibration	Acceleration and deceleration in the full-voltage operation, setting the rate in order to run efficiently in fixed-speed operation. Best suited for precision machine tool to reduce vibration	B8-01-02 H1-01-06

Function name	Applications	Purpose	Description	Related
Multi-speed Running	Conveyor	To implement the periodic operation of multi-stage presetting speed	Control 8-phrase speed operation with simple contact signals; also implement the simple position control with an external micro-switch.	D1-01-08 H1-01-06
Multistage Acceleration and deceleration Switch operation	Conveyor Rotary machinery	To switch acceleration and deceleration time by an external signal	To switch multi-stage acceleration and deceleration motor with an external signal, when an inverter driven 2 motors above, to perform high-speed / slowly start and stop function	C1-01-08 H1-01-06
Inverter Overheating warning	air-conditioner	Security maintenance	Inverter cause danger because of the surrounding temperature is high; the external heat switches can send a signal into the inverter to make the necessary warnings protective measures.	H1-01-06
Arbitrary Speed arrival Output	General occasion	Operation status signals	Converters Frequency at any arbitrary setting range can send out the signals to the external system or to circuit control.	L4-01-04 H2-01-03
Output Frequency Arrival 1	General occasion	Operation status signals	Inverter output frequency at any arbitrary value and above, it can send out the signals to external system to circuit control.	
Output Frequency Arrival 2	General occasion	Operation status signals	Inverter output frequency at any arbitrary value and above, it can send out the signals to external system or to circuit control.	
Base Block (BB) statues	General occasion	Operation status signals	When the inverter complement Base Block (output interrupt), it can send out a signal to external system or to control circuit.	H2-01-03

## Chapter 5 Trial Running

Function name	Applications	Purpose	Description	Related
Brake resistor overheat protection	General occasion	Security maintenance	When the inverter have installed Built-in braking resistor, it can send out a signal of braking resistor overheated or brake transistor anomalies.	L8-01
Frequency instructions Rapidly varied change	General occasion	Upgrade the continuity and reliability of operation	Frequency command value dropped drastically to 10% of the original set below; the inverter sends out the signals to external systems or to control circuit.	H2-01-03 L4-05
Analog Input	General occasion	Upgrade Operability	Inverter can be attached interface cards using high-resolution analog frequency command. External positive and negative voltage signal can directly control the forward/reverse operation of inverter.	F2-01
Analog output	General occasion	Display operation status	Inverter can be attached interface cards using high-resolution. Voltage, DC voltage signal plus the interface card can be displayed by applied frequency counter, voltage meter, current meter.	F4-01-04
Digital input	General occasion	Upgrade Operability	Inverter can be attached interface cards using digital frequency command (BCD 2 Bit/ BIN 8Bit) (BCD 4 Bit / BIN 16 bit)	F3-01
Pulse Output	General occasion	Display operation status	Inverter output frequency output into the interface card in way of the pulse output mode.	F7-01

Function name	Applications	Purpose	Description	Related
Digital Output	General occasion	Display operation status	The inverter failure conditions can output through 6 groups of optical coupling, and the two groups of electrical output.	F6-01
2C contact output card	General occasion	Display operation status	2 groups C contacts provide the running condition of inverter for the customers to control.	F5-01-03 H2-01-03
Multi-function Analog Input	General occasion	Upgrade Operability	Auxiliary frequency command of inverter, input voltage, and current adjustment can be controlled by an external analog signal.	H3-04-07
Multi-function Analog Output	General occasion	Display operation State	Inverter plus frequency ammeter can display operation frequency, output current, output voltage, DC voltage.	H4-01-06
Cumulative working hours	General occasion	Display Runtime	The computation of inverter running hour accumulation can be applied to calculate the work rate calculation.	02-07-08
Stall Prevention	General occasion	Upgrade the functional sustainability	Inverter can be set to detect current level when motor stalls, and prevent unnecessary downtime.	L3-01-06
Detection of Input/Output power phase failure	General occasion	Security maintenance	The inverter self-protection function for power supply or motor-side power phase failure to perform the necessary warning protective measures.	L8-05-07
PID Control Function	Air conditioner	Upgrade Operability	The use of PID to stabilize the scheduled and feedback numerical control output.	B5-01-08

## Chapter 5 Trial Running

Function name	Applications	Purpose	Description	Related
RS-232C/485 Communication card	General occasion	Upgrade Operability	The use of interface card reach one-to-many control with the PIC, or MOD-BUS communication.	H5-01-04

## 6. Control Mode Setting

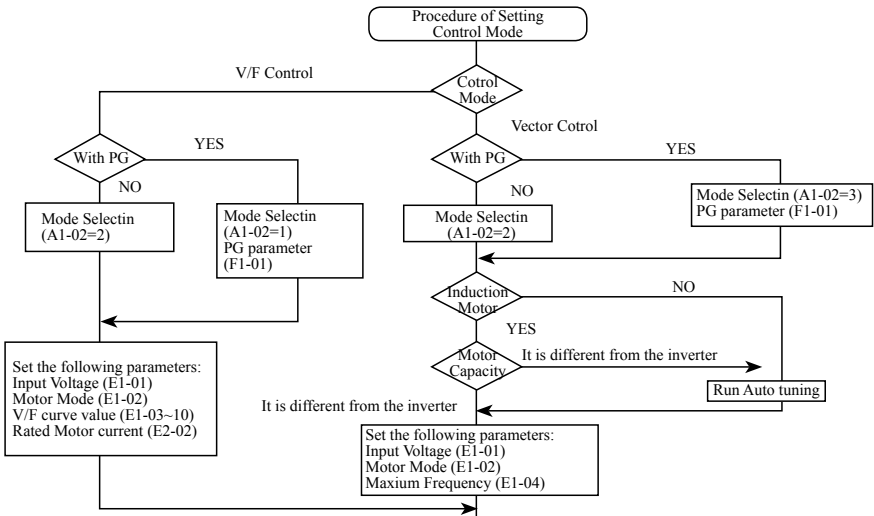

### 6.1 Four types of control mode selection

VG5 provides four control modes:

1. The current vector without PG control.
2. Current vector controls with PG. control.
3. V/F control without PG control.
4. V/F control with PG control.

Users can use the digital operators to choose control mode according to their application necessity.

The converter is set without following the PG control, please set motor control mode and related parameters according to the following procedures before using the VG5 series.

## 6.2 Feature of the control modes

Control Mode	V / F control without PG	V/F control with PG	Vector Control without PG	Vector Control with PG
Basic control	Voltage / frequency control (Open loop)	Voltage/ frequency control with Speed compensation	Current vector control without PG	Current vector control with PG
Speed detector	NO	YES (PG)	No	YES (PG)
Speed detector	NO	PG-A2, PG-D2	NO	PG-B2 PG-X2
Range of Speed control	1:40	1:40	1:100	1:1000
starting torque	150%/3HZ	150%/3HZ	150%/1HZ	150%/0HZ/min
Speed control accuracy	±2%~±3%	±0.03%	±0.2%	±0.02%
Torque control	NO	NO	NO	NO
Low-noise correspondence	Standard correspondence*	Standard correspondence*	Standard correspondence*	Standard correspondence*
Applicable purposes	<ol style="list-style-type: none"> <li>1. Simultaneously drive multiple motor</li> <li>2. Motor parameters unknown</li> <li>3. Unable to Auto tuning</li> </ol>	Mechanical side with pulse generator	Occasion to change the speed	<ol style="list-style-type: none"> <li>1. Simple Servo Driver</li> <li>2. High precision speed control</li> <li>3. Torque Control</li> </ol>

## 6.3 Adjustment of the control mode

The following example illustrates the operation procedures of control modes from the vector control without PG vector control with PG.

## Chapter 6 Control Mode Setting

Description	Key sequence	Operation displays
Frequency Command Display	MENU	Frequency Ref U1-01=60.00HZ
Action Mode Selection	↓   ↑	**Main Menu** Operation
Environment Setting Display	↓   ↑	**Main Menu** Initialize
Environment Settings Selection	READ / WRITE	Select language English
Parameter name change (Control mode display)	↓   ↑	Control Method Open Loop Vecctor
Press DATA / ENTER key, the parameter No, and setting values are displayed	READ / WRITE	A1-02=02 Open Loop Vector
Change control mode (Display V / F control)	↓   ↑	A1-02=00 v/f Control
Choose V / F control mode	READ / WRITE	Entry Accepted
Back to the action mode	MENU	**Main Menu** Operation
Back to the frequency command mode	READ / WRITE	Frequency Ref U1-01=60.00HZ

### 6.4 Auto-tuning Procedure

Note
<ol style="list-style-type: none"> <li>1. During Auto Tuning procedure, the motor runs automatically; please separate motors and mechanical parts for safety reason.</li> <li>2. During Auto Tuning procedure, the input signal of controlling loop terminal is invalid.</li> <li>3. During Auto Tuning procedure, there will have obvious electromagnetic noise when the motor is running because of the carrier frequency alteration to 2KHZ.</li> <li>4. Set the access level (A1-01) of environmental parameters to BASIC or ADVANCED, and then runs Auto Tuning procedure.</li> <li>5. Before Auto Tuning procedure, please confirm the stop status of motor, and then enter the RUN key.</li> </ol>

#### Operation procedure

Procedures	Operation
1 Safety confirmation	<ul style="list-style-type: none"> <li>• Motor and mechanical separation?</li> <li>• There are people around the motor shaft?</li> <li>• Mechanical brake release? (The occasion when motor with mechanical braking)</li> <li>• Rmoval of the shaft key on the motor Shaft?</li> </ul>

Procedures		Operation																		
2	Inverter power input	<ul style="list-style-type: none"> <li>• Confirmed that no failure occurred.</li> <li>• Confirmed PG turning direction. ( equipped with PG)</li> </ul>

## Chapter 6 Control Mode Setting

Procedures		Operation
5	Perform Tuning	<p>The direction of motor rotation is shown by the LED. <span style="border: 1px solid black; padding: 2px;">FWD/REV</span></p> <p>After press key FWD / REV to change the operation direction, Press key <span style="border: 1px solid black; padding: 2px;">RUN</span> When necessary.</p> <p>Tuning proceed Tuning completed, display "Tune Successful"</p> <p>(note) Press key <span style="border: 1px solid black; padding: 2px;">STOP</span> when Turning proceeding, Auto Tuning interrupted, motor gradually slow down until stop.</p>
6	Tuning complete	<ul style="list-style-type: none"> <li>• Tuning completed or interrupted, press key MENU to return to the action mode.</li> <li>• Perform Auto tuning again, repeat procedures 1-5.</li> </ul>

[Display of Anomaly and Countermeasures in Auto-Tuning Procedure]

When the following abnormal occasions occur, the digital manipulator will display anomaly, the motor gradually slow down until stop

Error Display	Content	Description	Solutions
Data Invalid	Motor data error	The motor data input for tuning is not correct.	<ul style="list-style-type: none"> <li>• To confirm input data.</li> <li>• Confirm inverter and motor capacity</li> </ul>
Resistance	Impedance between lines anomaly	Tuning is not completed within the specified time	<ul style="list-style-type: none"> <li>• To confirm input data.</li> <li>• Confirmed the motor wire specifications.</li> </ul>
No-Load current	No load current anomaly		
Saturation-1	Iron core saturation coefficient 1 anomaly		
Saturation-2	Iron core saturation coefficient 2 anomaly		
Rated slip	Rated slip anomaly		

Accelerate	Acceleration anomaly	Motor acceleration not completed within the specified time.	Acceleration time (C1-01) increased. If the motors and mechanical link together, please separate the motors and mechanical.
PG Direction	Direction of motor rotation anomaly	Inverter PG (A,B phase) and the motor (U, V, W) connection is not correct.	<ul style="list-style-type: none"> <li>• Confirmed the PG wiring.</li> <li>• Confirm motor wiring.</li> </ul>
Motor speed	Motor speed anomaly	Tuning, the torque command is excessive.(100 %)	<ul style="list-style-type: none"> <li>• If the motor and mechanical link together, please separate the motor and mechanical</li> <li>• Acceleration time (C1-01) excessive. Confirm the input data, especially the PC wave number</li> </ul>
ALARM: Over Load	Over load	Tuning, the torque command Change 20 %.	<ul style="list-style-type: none"> <li>• Confirm the input data, especially the PC wave number</li> </ul>
Turn Aborted Minor Failure □□□	Minor failure	Minor failure of inverter occur	Check the minor failure information of □□□
V/F Over Setting	V/F Over Setting	The torque command is over 100% during auto tuning and the no load current of generator is over 70 % of rated current	<ul style="list-style-type: none"> <li>• Confirm the setting value and correct it.</li> <li>• load of generator</li> </ul>

## 7 Parameter Description

### 7.1 A group parameter

Code	Name	Default	Description
A1-00	Select the Language	0	0: English
A1-02	Parameter read / write level	2	0: Monitor Private                      1: users choose 2: Quick Setup3: Basic Set            4: Advanced Settings
A1-02	Control Mode Selection	2	0: V / F control without PG    1: V / F control with PG 2: Vector Control without PG   3: Vector Control with PG
A1-03	Reset to factory setting	0000	1110 = Reset to user's value. 2220 = 2-wire reset. 3330 = 3-wire reset.
A1-04	Password1	0000	Enter 1 password
A1-05	Password	0000	Enter 2 password
A2-01 A2-32	User's Parameter		When A1-01 = 1 , A2-01 ~ 32 can be set up by the user's value to read / write parameters of NO

### 7.2 B group parameter

Code	Name	Default	Description	
B1-01	Frequency command selection	1	Settings	Description
			0	Operation command from digital manipulator
			1	Operation command from the control terminal
			2	Operation command from the serial communication
			3	Operation command from the Option Card
			4	MEMOBUS (CP-717 only)

Code	Name	Default	Description
B1-02	Torque command selection	1	<p>When stop running through the LOCAL REMOTE key, which can be able to select operation modes. LOCAL: frequency of command and operation command from digital manipulator. REMOE; frequency of command and operation of command by the parameters of B1-01 and B1-02.            Note; When input the power then the REMOTE to be set</p> <p>1. B1-01 = 1, the frequency of instruction for the terminal 13;            2. 14 together when terminals and configured for multifunctional input, frequency for terminals and instructions</p>
B1-03	Stop Methods	1	<p>① B1-03 = 00 Deceleration for stop            ② B1-03 = 01 free to stop</p> <p>(3) B1-03=02 all field DC brake</p> <p>(3) B1-03=03 free stop (with timer)</p> <p>The command will not run within T1 time after it stops inputting command. It will not run if there is no command input after T1 time</p> <p>A1-02 would only be able to set 00 or 01</p>

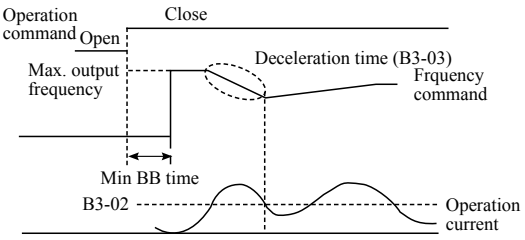

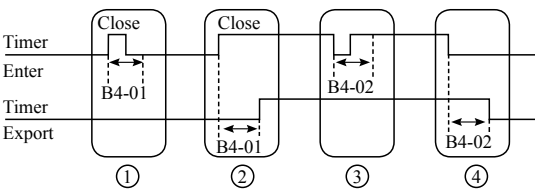

## Chapter 7 Parameters Description

Code	Name	Default	Description										
B1-04	Select ban on reverse	0	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 80%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Can be reversed to run</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Reverse run prohibited</td> </tr> </tbody> </table>	Value	Description	0	Can be reversed to run	1	Reverse run prohibited				
			Value	Description									
			0	Can be reversed to run									
1	Reverse run prohibited												
B1-05	The running selection under the lowest frequency situation	0	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 80%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Normal running (E1-09 invalid)</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Output Interrupt (BB)</td> </tr> <tr> <td style="text-align: center;">2</td> <td>Running on the lowest frequency</td> </tr> <tr> <td style="text-align: center;">3</td> <td>Zero-speed selection</td> </tr> </tbody> </table>	Value	Description	0	Normal running (E1-09 invalid)	1	Output Interrupt (BB)	2	Running on the lowest frequency	3	Zero-speed selection
			Value	Description									
			0	Normal running (E1-09 invalid)									
			1	Output Interrupt (BB)									
			2	Running on the lowest frequency									
3	Zero-speed selection												
<p>E1-09=0, this function is ineffective.</p> <p>A1-02=0 or 1 or 2, less than minimum frequency will bb motion.</p>													

Code	Name	Default	Description								
B1-06	Time option of terminal scanning twice	1	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>2msec</td> </tr> <tr> <td>1</td> <td>5msec</td> </tr> </tbody> </table>	Value	Description	0	2msec	1	5msec		
Value	Description										
0	2msec										
1	5msec										
B1-07	transferring option after swifting the operation command	0	<table border="1"> <thead> <tr> <th>Value</th> <th>Default</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td rowspan="2">0</td> <td>When local switch to the Remote, Remote command has been put into operation, running unavailable.</td> </tr> <tr> <td>1</td> <td>hen local switch to the Remote , Remote command has been put into operation , running immediately</td> </tr> </tbody> </table>	Value	Default	Description	0	0	When local switch to the Remote, Remote command has been put into operation, running unavailable.	1	hen local switch to the Remote , Remote command has been put into operation , running immediately
Value	Default	Description									
0	0	When local switch to the Remote, Remote command has been put into operation, running unavailable.									
1		hen local switch to the Remote , Remote command has been put into operation , running immediately									
B1-08	Local/Remote change	0	<p>Running order from internal (operate panel) change to external(control terminal) operation will be locked together.</p> <p>0: Change to external, input running order won't move            1: Change to external, follow running signal to move.</p>								
B2-01	Zero speed level (DC braking start frequency)	0.5	<p>When decelerate to stop, The settin unit for DC braking start frequency is 0.1HZ,</p> <p>When B2-01 &lt;E1-09, then the E1-09 as the DC braking start value</p>								
B2-02	DC Brake Current	50	<p>Setting unit for DC braking start frequency is 1% ,inverter rated current is 100%</p>								
B2-03	The Dc braking time when start	0.00	<p>When the motor rotation direction is uncertain, start DC braking in order to prevent the trip from the re-start when the motor in the situation of free run, the setting unit is 0.1 seconds.</p>								
B2-04	The DC braking time when stop	0.5	<p>To prevent the slip situation occurd when the motor stop,(Note) vector control with PG Please refer to the diagram of B1-05</p> <p style="text-align: center;">DC Braking Picture in start</p>								
B2-08	Flow compensation	0	<p>Magnatic compesation value. Take current value in non-loading as 100%</p>								

## Chapter 7 Parameters Description

Code	Name	Default	Description														
B3-01	Option of speed searching at start	0	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 80%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">Ineffective</td> </tr> <tr> <td style="text-align: center;">1</td> <td style="text-align: center;">Effective</td> </tr> </tbody> </table>	Value	Description	0	Ineffective	1	Effective

B5-03	PID I Time	1															
B5-04	PID I Limit	100															
B5-05	PID D Time	0															
B5-06	PID Limit	100															

Code	Name	Default	Description	
B5-07	PID Offset	0	<p>The Target value is set by the frequency of reference signal selection parameters (B1-01), when B1-01 = 0, It can be through speed command parameters 1-3 (H1-03, H1-04, H1-05) or the jog command signals H1-06 as a target value. When S1-01 = 1, the target value from terminal 13 or 14 analog input signal.</p>	
B5-08	PID Delay Time	0		
B5-09	PID Forward /Reverse	0		
B5-10	PID Output Gain	1		
B5-11	PID Reverse output mode	0		
B5-12	PID Feedback Loss Output	0		
B5-13	PID Feedback Loss Output Detection Level	0		
B5-14	PID Feedback Loss Output Detection Time			
	Connects to the last page			<p>Temperature</p> <p>Under following condition the I value will be reverted to 0</p> <ul style="list-style-type: none"> <li>• Input the stop command or stop in.</li> <li>• When the multi-function terminal set on “called the PID control” and Inputting terminal on the condition of “closed”.</li> <li>• When the Multi-terminal PID control integral reset have been chosen, and the terminal closed is the integral reset, In running, when the multi-functional terminal is set to "called the PID control", the target signal will be treated as frequency command signal .</li> </ul> <p>The limitation of “I” can be set by the B5-04, To increase the ability of controlling brake from integral- constant (increase the value of B5-04). When the control system oscillated, which can not be solved by the adjustment integral-constant time or the principal constant- time, reduce the value of B5-04?</p>

## Chapter 7 Parameters Description

Code	Name	Default	Description
B6-01	DWELL start frequency	0.0	<p>When the Motor-driven on a heavy load, and if it is required to suspend the acceleration in order to facilitate the start or suspend the deceleration, This escape function is called DWELL.</p> <p>The suspension of accelerating frequency when speed up. B6-01 <math>\leq</math> E1-09 when starts DWELL function is invalid. The suspension of accelerating time when speed up. The suspension of decelerating frequency B6-03 <math>\leq</math> E1-09, when stopped DWELL function is invalid</p>
B6-02	DWELL time to start	0.0	
B6-03	Frequency of stops DWELL	0.0	
B6-04	Stop the time when the DWELL	0.0	
B7-01	Droop Control Gain	0.0	<p>Droop control provides a corresponding change of load in the rate of decline to a certain percentage of the function. B7-01 is a rated torque of 100% corresponding to maximum speed (E1-04) a decline in the ratio. Reduce the B7-02 settings, Droop's response sooner, but this would result in pursuit of the motor behavior.</p>
B7-02	Control Delay Time	0.00	<p>This feature is restricted to the A1-02 = 3 (with PG vector control) mode.</p>
B8-01	Saving Energy Gain	80	<ul style="list-style-type: none"> <li>• After acceleration is complete, the current of load will become small: in this case, through the reducing of output voltage which will achieve the energy saving purpose.</li> <li>• Set the Multi-function input terminals to "energy saving" command, and the frequency reach to the rate of energy saving (B8-02), the output voltage begins to lower.</li> <li>• Energy efficient running of the output voltage as the normal of V / F settings (E1-03 ~ 13) <math>\times</math> Saving Energy Gain (B8-01), the output voltage reduction and recovery time set by L2-04</li> </ul>

<p>B8-02</p>	<p>Start frequency of energy Saving</p>	<p>0.0</p>	<p>Forward</p> <p>Saving Energy command value = 63</p> <p>Output frequency</p> <p>Output voltage</p> <p>Frequency command B8-02</p> <p>L2-04</p> <p>E1-03 ~10 x E8-01</p>
			<p>In A1-02=0, this function is effective</p>
<p>B9-01</p>	<p>Zero Servo Gain</p>	<p>5</p>	<p>Zero speed servo motor function is that when the motor speed below the Inverter's zero-speed level of the implementation of position control. Zero-servo gain settings. Zero servo completion of width, set the PG Pulse as one unit.</p> <p>Multi-input value = 72</p> <p>Open</p> <p>Close</p>
<p>B9-02</p>	<p>Zero-servo completion of width</p>	<p>10</p>	<p>Motor speed</p> <p>Default = 0.5Hz</p> <p>(B2-01)</p> <p>Motion</p> <p>Speed control</p> <p>Zero-servo</p> <p>(B9-02)</p> <p>Position deviation</p> <p>Open</p> <p>Close</p> <p>Set B9-02 for 33</p>

### 7.3 C group parameter

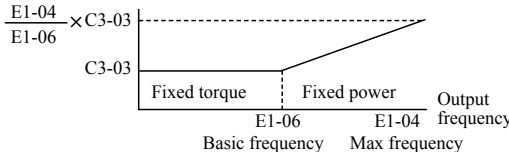

Code	Name	Default	Description

Value	Description																
0~E	Constant Curve																
F	Arbitrary V / F Curve																
E1-03	V/FCurve	OF	Refer to to Appendix 1Table1 1 Table 2														
E1-04	Maximum output frequency	60.0	<p>In E1-03 = F, V / F curve values can be set E1-04 ~ 13</p> <p>The graph shows a V/F curve with Voltage (V) on the y-axis and Frequency (f) on the x-axis. The curve starts at point E1-09 (0 frequency) and passes through points E1-07, E1-06, E1-11, and E1-04. Horizontal dashed lines from the y-axis indicate voltage levels for E1-10, E1-08, E1-12, and E1-05. Vertical dashed lines from the x-axis indicate frequency levels for E1-09, E1-07, E1-06, E1-11, and E1-04.</p>														

## Chapter 7 Parameters Description

Code	Name	Default	Description	
E1-05	Maximum voltage	200.0	<p>Please set the frequency by <math>E9-09 \leq E1-07 \leq E1-06 \leq E1-11 \leq E1-04</math> the order according to the size.</p> <p>(Note) When raise on value of V in the V curve, then the motor torque will go large, exceeding value of V will get the following circumstances:</p> <ul style="list-style-type: none"> <li>• The current flow through motor is too high which cause inverter failed.</li> <li>• Motor will get heat and vibration and so on.</li> </ul> <p>Therefore, raise the V value step by step and check if the motor current is simultaneous.</p>	
E1-06	Basic voltage frequency	60.0		
E1-07	Middle output frequency	3.0		
E1-08	Intermediate Output frequency voltage	11.0		
E1-09	Minimum output frequency	0.5		
E1-10	Minimum output frequency voltage	2.0		
E1-11	Middle output frequency	0.0		
E1-12	Intermediate output frequency voltage	0.0		When E1-13 is set for 0 the based voltage is maximum
E1-13	Basic voltage	0.0		
E2-01	Motor rated current	1.9		<p>The motor rated current under 7.5KW , then 0.01A is the unit , 11KW and above then 0.1A is the unit. Motor Rated Slip difference based on 0.01HZ as unit (RPM)-(HZ) Convert to formula is as follows:</p> $F_s (\text{Rated poor}) = (\text{rated frequency}) - \frac{(\text{Rated Speed (rpm)}) (\text{Poles})}{120}$ <p>Motor no-load current below 7.5KW then 0.01A as unit, 11KW and above 0.1A is the unit.</p> <p>In order to set the number of motor pole Line impedance between the motor unit set up to <math>0.01 \Omega = (\text{Interphase Impedance}) *</math></p> <p>Light motor leakage reactance of 0.1% of the units set</p> <p>Magnetic beam 50% of the motor iron core saturation coefficient set. (Auto tuning automatically set)</p> <p>Magnetic beam 75% of the motor iron core saturation coefficient set. (Auto tuning automatically set)</p> <p>Motor mechanical loss to 0.1% as the unit set the motor rated output of 100%.</p>
E2-02	Motor rated Slip	2.9		
E2-03	Motor non-load current	1.20		
E2-04	Motor Pole	4		
E2-05	Motor cable in impedance	9.842		
E2-06	Motor light leakage reactance	18.2		
E2-07	Motor iron core saturation coefficient 1	0.5		
E2-08	Motor iron core saturation coefficient 2	0.75		
E2-09	Motor iron loss	0.0		
E2-10	Torque compensation of motor iron loss	14		

Code	Name	Default	Description
E4-01	Maximum (motor 2)	60	V/F curve setting
E4-02	Maximum output voltage (Motor2)	400	V/F curve setting
E4-03	Basic Frequency (Motor2)	60	V/F curve setting
E4-04	Intermediate output frequency (Motor2)	3.0	On the occasion of E1-03="F", the parameters of E1-04~E1-10 can be set. In "V / F characteristic with straight line, then set the E1-07(Intermediate output frequency) and E1-09(Lowest frequency) to be the same value. At this point E1-08 (Intermediate output voltage) is independent.
E4-05	Lowest output Voltage (Motor2)	22.0	Same as above
E4-06	Lowest output Frequency (Motor 2)	0.5	Same as above
E4-07	Lowest output Voltage	4.0	Same as above
E5-01	Rated motor current (Motor 2)		The setting range is 10~100% of rated current, the factory setting is according to the inverter power, please set the rated current value according to motor nameplate information.
E5-02	Rated motor slip (Motor 2)		The factory setting is according to power of inverter, calculate and set the rated slip from information of the nameplate. Motor rated slip = motor rated frequency - Rated RPM * Motor's pole / 120
E5-03	Motor current without load (Motor 2)		The factory setting according to the inverter power, set motor current in non-loading when the motor is in the rated voltage and frequency.
E5-04	The pole of motor (Motor 2)		Set the motor of pole according to the motor plate information.
E5-05	Motor resistor between lines (Motor 2)		The factory setting is according to the inverter power, please measure the motor resistor between lines (U-V, V-W, W-U), Usually the nameplate on the motor does not recorded.
E5-06	Motor resistor leakage(motor 2)		Voltage drop caused by the motor leakage resistor. Rated voltage of compared motor is set by %. The factory setting is according to the capacity lakage inductance which causes to drop voltage contrasts to percent of rated motor voltage as setting.

### 7.6 F Group Paramater

Code	Name	Default	Description
F1-01	PG Constant	600	The pulse number of encorder per revolution
F1-02	The operation mode when detecting the PG disconnection.	1	When detecting the PG disconnection , the setting of stop method 0: decelerately stop (deceleration time: C1-02) 1: Free stop 2: Emergent stop (deceleration time: C1-09) 3: Continue running (display only disconnection, it can not be set when A1-02 = 3)
F1-03	Over speed detection the Action Mode	1	Over speed detection, the stop method of setting. 0: decelerately stop (deceleration time: C1-02) 1: Free stop 2: Emergent stop (deceleration time: C1-09) 3: Continue running (only show the speed, it can not be set in A1-02=3)
F1-04	Detection bias is too large, the Action Mode		Speed deviation is too large, the setting of stop method 0: decelerately stop (deceleration time: C1-02) 1: Free stop 2: Emergent stop (deceleration time: C1-09) 3: Continue running (only show bias when it is too large)
F1-05	PG rotation direction	0	The relationship between motor rotation direction and PG polarity, it is ineffective when using PG-A2, D2 card. 0: A-phase motor ahead of B-phase 90 °. 1: Motor reverse-phase in the A's ahead of B-phase 90
F1-06	The rate of division on PG signal (with PG card effective)	1	Set the rate of division on PG pulse as a monitor. (The setting of rate of division on PG-signal) The rate of PG= N-1/ M ( Setting range 1/1~1/32 ) n: 0,1 m:1~32
F1-07	Acceleration & deceleration in the integral control	0	Acceleration and deceleration in the speed control loop (ASR) whether the implementation of the integral actions or not 0: integral action is ineffective 1: integral action Effective

Code	Name	Default	Description
F1-08	Over speed detection of level	115	<p>Motor over speed detection quasi-spaces to E1-04 (maximum frequency) to 100%.</p> <p>Time setting is between the detected over speed and the given abnormal signal.</p> <p>When the motor speed's absolute value is more than F1-08 value, and over speed is longer than F1-09 value, the abnormal signal will output and stop running.</p>
F1-09	Over speed detection time	0	<p>Over speed level (F1-08)</p> <p>Over speed (Abnormal signal)</p> <p>F1-09</p> <p>“open”</p> <p>“Close”</p> <p>The absolute value of motor</p>
F1-10	Over speed deviation detection level	10	<p>Over speed deviation detection level is 100% based on E1-04 (Max. Frequency)</p>
F1-11	Speed deviation beyond detection time	0.5	<p>Time setting is between detected speed deviation and the abnormal signal.</p> <p>When the speed command and motor speed deviation is more than F1-10 value, and deviation time is longer than F1-11 value, the abnormal signal will output and stop running.</p> <p>Speed command F1-10</p> <p>Motor Speed</p> <p>Speed deviation is too large (abnormal signal)</p> <p>F1-11</p> <p>“open”</p> <p>“close”</p> <p>“open”</p>
			<p>On the condition of accelerate / decelerate speed or torque control, the detection is ineffective</p>
F1-12~13	PG Gear number of deceleration 1~2	0 0	$\text{motor speed [r/min]} = \frac{\text{PG output p/r} * 60}{\text{PG constant (F1-01)}} \cdot \frac{\text{Gear Reducer 2}}{\text{Gear Reducer 2 (F1-12)}}$ <p>This function will be ineffective when F1-12=0 &amp; F1-13=0</p>
F1-14	PG section line detection delay time	2.0	<p>PG disconnection time settings when the abnormal</p>

## Chapter 7 Parameters Description

Code	Name	Default	Description																		
F2-01	Analog input card	0	<p>When analog input card is installed, CH1-3 of the input function options.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Function</th> <th>CH1 (TC1-TC4)</th> <th>CH2 (TC2-TC4)</th> <th>CH3 (TC3-TC4)</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>3CH single input</td> <td style="text-align: center;">Displace terminal (13)-(17)</td> <td style="text-align: center;">Displace terminal (14)-(17)</td> <td style="text-align: center;">Displace terminal (16)-(17)</td> </tr> <tr> <td style="text-align: center;">1</td> <td>3CH added inputting</td> <td colspan="3" style="text-align: center;">The sum up of CH1-3 value as the frequency of instruction.</td> </tr> </tbody> </table> <p>The function of multi-input and the machine designaed on switch ( setting value 02) will be ineffective if inserting A1-14B card</p>	Value	Function	CH1 (TC1-TC4)	CH2 (TC2-TC4)	CH3 (TC3-TC4)	0	3CH single input	Displace terminal (13)-(17)	Displace terminal (14)-(17)	Displace terminal (16)-(17)	1	3CH added inputting	The sum up of CH1-3 value as the frequency of instruction.					
			Value	Function	CH1 (TC1-TC4)	CH2 (TC2-TC4)	CH3 (TC3-TC4)														
0	3CH single input	Displace terminal (13)-(17)	Displace terminal (14)-(17)	Displace terminal (16)-(17)																	
1	3CH added inputting	The sum up of CH1-3 value as the frequency of instruction.

\*\* H3-09 is effective when set on 1F

Value	Description
00	<p>H1-01=00 Three-wire mode of H1-01 ~ 06 , value 00 of the control terminals for Forward / Reverse, running.</p> <pre> graph TD     STOP((STOP)) --- T1(( ))     T1 --- T2(( ))     T2 --- T3(( ))     T3 --- T4(( ))     T4 --- T5(( ))     T5 --- T6(( ))     T6 --- T7(( ))     T7 --- T8(( ))     T8 --- T9(( ))     T9 --- T10(( ))     T10 --- T11(( ))     T11 --- GND[Ground]     </pre> <p style="margin-left: 40px;">             1 ○ RUN command ( "Close" Run)              2 ○ STOP command (Open" Stop)              3 ○ FWD/REV ( "Open" FWD,"Close" REV)         </p>

Value	Description
	<p>TIMING DIAGRAM</p> <p>The diagram shows the following signal transitions:</p> <ul style="list-style-type: none"> <li><b>RUM "OPEN"</b>: Starts high, then drops to low at the first "CLOSE" event.</li> <li><b>STOP "OPEN"</b>: Starts high, then drops to low at the first "CLOSE" event.</li> <li><b>FWD / REV</b>: Starts at FWD, switches to REV during the "Above 50CM" period, and returns to FWD after the second "CLOSE" event.</li> <li><b>MOTOR SPEED</b>: Ramps up during FWD, ramps down during REV, and then ramps up again during the final FWD phase.</li> <li><b>MOTION STOP</b>: Shows three phases: Run FWD, Run REV, and STOP, each with a pulse width.</li> </ul>
01	<ul style="list-style-type: none"> <li>• LOCAL /REMOTE mode The switch of running signal is effective on stopping. Open: In REMOTE, set the value of running according to B1-01, B1-02. Closed: In LOCAL, running according to the manipulator of frequency command. (Note) When terminal of multi-function sets for LOCAL/REMOTE, the LOCAL/REMOTE key is ineffective on the panel.</li> </ul>
02	<ul style="list-style-type: none"> <li>• Optional cards / inverter switch. It is effective when stop. Open: operate in accordance with inverter control circuit terminals or operate in accordance with the frequency demand and operation signal from digital manipulator Closed: operate in accordance with the frequency command and operation command from optional card.</li> </ul>
08	<ul style="list-style-type: none"> <li>• External bb (output interrupt) Execute the bb operation in terminal "closed", the panel is blinking bb signal, when bb signal disappears and then inverter will run in accordance with the frequency command of disconnection. Input BB signal after inputting the stop signal, the display will appear BB blinking, and then inverter stop outputting.</li> </ul>
09	<ul style="list-style-type: none"> <li>• External bb (output interrupt) In terminal "on", and then run the bb.</li> </ul>
0A	<ul style="list-style-type: none"> <li>• The command to suspend the acceleration and deceleration When input the command to suspend the acceleration and deceleration, then the motion of acceleration and deceleration will stop, maintain the current output frequency output signal when lifted operation signal then the command to suspend to acceleration and deceleration will be lifted at same time.</li> </ul>

## Chapter 7 Parameters Description

Value	Description
	<p>D4-1 = 1 when input the pause command to the acceleration and deceleration while running, after inputting the pause command then input the running command, the output frequency of HOLD will be memorized. upto the pause command to the acceleration and deceleration has been lifted. As result the HOLD of output frequency will keep running.                      In D4-1 = 0, HOLD output frequency is not in memory.</p>
0B	<ul style="list-style-type: none"> <li>Inverter overheating warning</li> </ul> <p>When input the Inverter overheating signal, the digital manipulator displays OH2.</p>
0C	<ul style="list-style-type: none"> <li>Multi-function analog input effective / ineffective</li> </ul> <p>Open: Multi-function analog input is ineffective.                      Closed: Multi-function analog input is effective.</p>
0D	<ul style="list-style-type: none"> <li>Speed control cancel</li> </ul> <p>Open: Speed control is effective (closed-loop control).                      Closed: Speed control is ineffective (open loop control).</p>
0E	<ul style="list-style-type: none"> <li>Speed control integral value reset</li> </ul> <p>In F1-07 (The options of integral control for acceleration and deceleration) = 0, this function effectively.                      Speed control integral reset even if the operation is also effective.                      Open: PI control, speed control plus the integral value is counted.                      Closed: P control, integral time constant is reset.</p>
1C.1D	<p>+SPEED command, -SPEED command                      Frequency command and D4-02 set value relative to addition and subtraction, Frequency command</p>  <p>Note: a frequency command to d1-01 ~ 09 hours + SPEED,-SPEED command is ineffective                      2 When set the + SPEED /-SPEED command which will be displayed (OPE3) failure at the same time</p>
1E	<p>Analog command sampling maintain: 100msec after closed the analog input value as the frequency instruction, sample / hold</p> 

Value	Description															
	<p>Notes: 1. Analog sampling frequency of instruction / Hold terminals 13.14.16.A1-14U.B. Use the card corresponds to an effective analog input.</p> <p>2. Acceleration and deceleration to stop (OA) UP / DOWN command (10.11) + SPEED-SPEED instruction 1C.1D analog frequency instructions S / H (1E) is set at the same time more than 2, then display OPE03</p>															
10.11	<p>• UP/DOWN instruction</p> <p>When input the Forward (Reverse) command, if want to change the frequency command, then the UP and DOWN signals can be used for execution of acceleration and deceleration.</p> <p style="text-align: center;"><b>Set value = 10 UP signal                      Set value =11 DOWN signal</b></p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>UP</td> <td>close</td> <td>open</td> <td>open</td> <td>close</td> </tr> <tr> <td>DOWN</td> <td>open</td> <td>close</td> <td>open</td> <td>close</td> </tr> <tr> <td>Status</td> <td>Acceleration</td> <td>deceleration</td> <td>HOLD</td> <td>HOLD</td> </tr> </table> <p>U = UP (accelerating) status  D = DOWN (deceleration) state  H = HOLD (a certain speed) status  U1 = acceleration to the higher limit of frequency  D1 = deceleration to the lower limit of frequency</p> <p>Note: 1. When use UP/DOWN command, B1-01 require to be set for 1.  2. The maximum speed limit = maximum output frequency (E1-04) * Frequency command upper limit (D2-01).  3. Lower speed limit to the frequency command lower limit (D2-02) or the main part of either control circuit terminal 13 or 14 is the biggest.  4. In D4-01 = 1, then input the acceleration and deceleration command, when the power OFF, the current output frequency will be memorized.  5. When the UP/DOWN command is execute under running status, if input the jog command, the jog command will be a top priority for execution.  6. UP/DOWN command, without at the same time setting, OPE03 display.  7. When the command of stopping acceleration and deceleration in Multi-functional terminal has set at same time, n, OPE03 display.</p>	UP	close	open	open	close	DOWN	open	close	open	close	Status	Acceleration	deceleration	HOLD	HOLD
UP	close	open	open	close												
DOWN	open	close	open	close												
Status	Acceleration	deceleration	HOLD	HOLD												

## Chapter 7 Parameters Description

Value	Description
12,13	<ul style="list-style-type: none"> <li>• FJOG command, RJOG command Implementation of the Forward and reverse jog command. Set value = 12FJOG command: "closed", the implementation of the Forward jog command (D1-09). Set value = 13RJOG command: "closed" the implementation of reverse jog command (D1-09).</li> </ul> <ol style="list-style-type: none"> <li>1. When input the FJOG command or RJOG command under running status, RJOG and FJOG command will be top priority to execute.</li> <li>2. When inputting the value over 500ms under the FJOG command and RJOG command at the same time, the inverter will stop according to B1-03 of set the stop method.</li> <li>3. FJOG command, RJOG command can be set and use individually.</li> </ol>
14	<ul style="list-style-type: none"> <li>• Irregular Reset: Close: Implementation of an irregular reset action</li> </ul>
15	<ul style="list-style-type: none"> <li>• Emergent stop (A contact) Terminal "close", excute the emergent stop, the stop time is according to the setting value of C1-09.</li> </ul>

60	<p>DC-braking command When inverter stops and the DC-brake command is input, the implementation of the DC-braking will act. When operation command is input, DC braking will be released and it will be running. (Run firstly)</p> <p>(Note:A1-01=3, the initial excitation effective)</p>																																																																																																																																																																																																																	

## Chapter 7 Parameters Description

Value	Description
61~62	<p>Speed searching command</p> <p>When the power or inverter is switched, the speed search function should be used to start the motor, to prevent the inverter from escaping.</p> <p>The speed searching begins from the highest frequency when the setting value is 61.</p> <p>The speed search begins from the setting frequency rate when the setting value is 62.</p> <p>In the base block, speed of the searching command is "closed" and the operation command input, the searching speed will act in a minimum base block time (L2 -03)</p> <p>Notes: 1. Regardless of the operation instructions or speed of the search command, searching speed begins from output frequency in the immediate continuous mode. The searching speed is completed according to operation instruction</p> <p>2. Speed search command values can not be set 61 and 62 at the same time, result in (OPE3)</p>

## Chapter 7 Parameters Description

The option of multi-functional output terminal. The option of control circuit terminals (9), (25), (26)

Value	Description
00	In operation When the inverter has output voltage or the operation command input contact is "closed"
01	<p>Zero speed In VF control with PG card, when the output frequency is lower than minimum frequency (E1-09), the contact is closed. In Vector control with PG card, when the motor speed is lower than speed zero (B2-01), the contact is closed.</p>
02	Arrival frequency 1 When the output frequency is in the output frequency command-L4-02 $\cong$ SFS output frequency $\cong$ command + L4-02 detection range, the contact is "closed"
03	Radom arrival frequency 1 When the output frequency follows the setup = 2 and in the detection range of L4-01—L4-02 $\cong$ SFS output ) $\cong$ L4-01+L4-02, the contact is "closed."
04	Frequency detection 1 When the outputting frequency is in detection range of the SFS output (symbol-free) $\cong$ L4-01 + L4-02., the contact is "closed."
05	Frequency detection 2 When the output frequency detection range is above the SFS output (symbol-free) $\cong$ L4-01, the contacts is "closed".
06	The inverter completes operation When the inverter completes operation, the contact is "closed."

Value	Description
07	<p>Low-voltage detection The main circuit or control circuit voltage is too low or the main circuit magnetic contactor is OFF, the contact is "closed."</p>
08	<p>In basd block, when inverter output "base block ",the contact is "closed."</p>
09	<p>Frequency command mode In operation, frequency commands from the control circuit terminals or the election supplies, the contact is "closed." In operation, frequency commands from the operating device, the contact is "closed."</p>
0A	<p>Operation command mode When the operation instruction is from the control circuit terminals or the election supplies, the contact is "open."</p>
0B	<p>Torque detection 1 When the torque detection 1 was detected, the contact is "closed."</p>
0C	<p>Frequency command loss When frequency command loses, the contact is "closed." Example: L4-05 = 1, the current speed frequency is always associated with 0.4 seconds to compare with the main-speed frequency, when the main-speed frequency below 10 % of the main-speed frequency, the motor will continue to run with 80% of the main-speed frequency rate in 0.4 seconds earlier. Meanwhile this point frequency command is losing, and the contact is "closed."</p> <p>The diagram illustrates the timing of the contact closure during a frequency command loss. It shows four signals over time:         <ul style="list-style-type: none"> <li><b>Frequency Command:</b> A step function that drops from a high level to a low level.</li> <li><b>Main Speed Frequency:</b> A trapezoidal wave that ramps down from a high level to a low level.</li> <li><b>80% Frequency Rate:</b> A trapezoidal wave that ramps down from a high level to a low level, starting 0.4s before the main speed frequency reaches 10%.</li> <li><b>Close Contact:</b> A pulse that occurs when the main speed frequency is below 10%.</li> </ul>         Horizontal dashed lines indicate the 80% and 10% frequency levels. Vertical dashed lines and arrows indicate the 0.4s time intervals.     </p>

## Chapter 7 Parameters Description

Value	Description
0D	Bad brake resistor Brake resistor or brake overheating abnormal crystal contacts as "closed."
0E	Abnormality The contact point is "closed" in Abnormality except CPF00 and CPF0
10	Alarm The contact point is "closed" in alarm
11	Abnormality reset The contacts is "closed" in Abnormality reset
12	Timer The contact is "closed" in output of the timer
13	Arrival frequency 2 The output frequency is in the following range, the contact point will be "closed." Frequency command-L4-04 $\cong$ SFS output frequency $\cong$ command + L4-04.
14	Random frequency 2 When setting value of the output frequency is 13 or the following detection range, the contact point will be "closed." L4-03-L4-04 $\cong$ SFS output frequency (with symbols) $\cong$ L4-03+L4-04.
15	Frequency detection 3 The output frequency detection is in the range of SFS output (with symbols) $\cong$ L4-03, the contact is "closed."
16	Frequency detection 4 The output frequency detection is in the range of SFS output (with symbols) $\cong$ L4-03, the rcontact is "closed."
17	Torque detection 1 When the torque detection 1 is detected, the contact is "open." Please refer to L6-01 ~ 03
18	Torque detection 2 When torque detection 2 is detected, the contact is "open." Please refer to e L6-04, 05,07
19	Torque detection 3 When torque detection 2 is detected, the contact is "open." Please refer to e L6-04, 05,07
1A	In reverse The contact point is "closed" in reverse
1B	In BASD BLOCK The contact point is "open" in the base block

Value	Description
1D	Regeneration mode The contact point of regeneration mode is closed in vector control mode with PG
1E	Abnormality restart The contact point is "closed" in abnormality
1F	OL1 Alert The contact point is "closed" in 90% of the accumulative value of Electronic Thermal Power.
20	OH Alert The contact point is "closed" in the temperature more than rated.
30	Torque limit The contact point is "closed" in torque limit.
31	Speed limit 1. frequency command capped d2-01 2. torque control, the speed reaches the speed limit quasi-position, the contact is "closed." 3. frequency command lower limit d2-02, = 09 multi-function analog input
33	Zero servo achievement The contact point is "closed" in zero servo achievement
37	In operation 2 The initial contact point is "closed." in operation except base block and DC brake

## Chapter 7 Parameters Description

Code	Name	Default	Description								
L1-01	Motor Protection	1	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Setup</th> <th style="width: 90%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Electronic Thermal Power is ineffective</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Electronic Thermal Power is effective</td> </tr> </tbody> </table> <p>When one inverter simultaneously drives several motors, please insert Electronic Thermal Power to protect from overloading for the motors. When the inverter power supply is OFF, the measurement value of motor temperature is to 0. Therefore, apply to the inverter power supply is in OFF condition, this function may be ineffective.</p>	Setup	Description	0	Electronic Thermal Power is ineffective	1	Electronic Thermal Power is effective		
			Setup	Description							
0	Electronic Thermal Power is ineffective										
1	Electronic Thermal Power is effective										
L1-02	Motor Protection Time	1.0	<p>When the motor is running over rated current more than 150% of the load Electronic Thermal Power will be set. Please set value according to motor capacity</p> <p style="text-align: center;">Example of Electronic Thermal Power: L1 - 02 = 1.0 at 60Hz running</p>								
			<p>In instantaneous power failure, the inverter stops when the power failure is detected, the option for "restart running function" after recovering the power.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Setup</th> <th style="width: 90%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.</td> </tr> <tr> <td style="text-align: center;">2</td> <td>Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.</td> </tr> </tbody> </table>	Setup	Description	0	Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action	1	Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.	2	Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.
Setup	Description										
0	Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action										
1	Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.										
2	Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.										
L2-01	Action mode in immediate power failure occurs	0	<p>In instantaneous power failure, the inverter stops when the power failure is detected, the option for "restart running function" after recovering the power.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 10%;">Setup</th> <th style="width: 90%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.</td> </tr> <tr> <td style="text-align: center;">2</td> <td>Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.</td> </tr> </tbody> </table>	Setup	Description	0	Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action	1	Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.	2	Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.
Setup	Description										
0	Restart the operation ineffective The detection of Power failure, the abnormal contact takes an action										
1	Restart the operation effective after recovering power. In L2-02 setting time of recovering power, run "restart running function" Meanwhile the abnormal contact is not in action. Without recovering power in L2-02, the abnormal contact take an action.										
2	Restart the operation effective after recovering power. Nothing about L2-02 setting time of recovering power, as long as inverter action in the range, run "restart running function after recovering power and the contact is not in action.										

Code	Name	Default	Description								
L2-02	Ensuring time of Immediate Stop	0.7	Instantaneous power failure occurs, and the re-start the operation after power (L2-01 = 1) choice of the blackout time allows, the value set. In the recovery of electricity within the warranty period, then the implementation of the re-start the operation. If the period from the power outage to ensure that there is no resumption of power, then after the warranty period, the abnormal contact action.								
L2-03	Minimum time of base block	0.5	When it restarts after power detects, there is still some current in the motor. If restarting instantly, the over-current will enter the motor, which will cause the converter to get failed. Minimum-time of the base block is the standby time which the motor needs consuming the residual electricity. The motor will be effective when setting for 1 or 2. The minimum-time of the base block is less than recovery time, it will restart.								
L2-04	Voltage return time	0.3	When restarting in power-supply failure, the speed search will run in order to detect the speed of the motor. And then, the input voltage will return the normal V/F curve in required time. 220V stage: 0 →220Vde 440V stage: 0 →440Vde								
L2-05	Low voltage detection	190	Set the voltage of the inverter's main loop of DC power to be the level of LV detection. When the input side has installed AC reactor, the value should be less than the standard. 220V stage: 190V 440V stage: 380V								
L3-01	Motor stall prevention in acceleration	1	<p>The setting of motor stall prevention in acceleration:</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Motor stall prevention is ineffective in acceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor.</td> </tr> <tr> <td>1</td> <td>Motor stall prevention is effective in acceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current.</td> </tr> <tr> <td>2</td> <td>The mode of most proper acceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in acceleration.</td> </tr> </tbody> </table>	Value	Description	0	Motor stall prevention is ineffective in acceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor.	1	Motor stall prevention is effective in acceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current.	2	The mode of most proper acceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in acceleration.
Value	Description										
0	Motor stall prevention is ineffective in acceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor.										
1	Motor stall prevention is effective in acceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current.										
2	The mode of most proper acceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in acceleration.										

## Chapter 7 Parameters Description

Code	Name	Default	Description								
L3-02	The level of motor stall Prevention in acceleration	150	When Vector function (L3-01=1) or most proper acceleration (L3-01=2) is chosen, the inverter will auto adjust acceleration rate preventing the motor from overtaking the setting value.								
L3-03	The limitation of motor stall prevention in acceleration	50	<p>When the motor is used to a certain range, vector function will reduce speed according to acceleration.</p>								
L3-04	Motor speed loss prevention in deceleration	1	<p>The setting of motor speed loss prevention in deceleration:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Motor speed loss prevention is ineffective in deceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Motor speed loss prevention is effective in deceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current</td> </tr> <tr> <td style="text-align: center;">2</td> <td>The mode of most proper deceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in deceleration.</td> </tr> </tbody> </table> <p>In using the braking unit, set this function for 0, the motor chase also does so. In vector control, the function (L3-04=2) cannot be set.</p>	Value	Description	0	Motor speed loss prevention is ineffective in deceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor	1	Motor speed loss prevention is effective in deceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current	2	The mode of most proper deceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in deceleration.
Value	Description										
0	Motor speed loss prevention is ineffective in deceleration. Whatever status of the motor, the inverter will take output frequency according to the setup. Overload may cause loss-speed in the motor										
1	Motor speed loss prevention is effective in deceleration. Automatically reduce acceleration to prevent the motor from losing speed according to the motor current										
2	The mode of most proper deceleration Monitor the motor current. Ignore time setting of speed up/down, but it will be the shortest in deceleration.										
L3-05	Stall prevention in running	1	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Setup</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>In running, stall prevention is ineffective</td> </tr> <tr> <td style="text-align: center;">1</td> <td>In running, stall prevention is effective</td> </tr> <tr> <td style="text-align: center;">2</td> <td>In running, stall prevention is effective</td> </tr> </tbody> </table>	Setup	Description	0	In running, stall prevention is ineffective	1	In running, stall prevention is effective	2	In running, stall prevention is effective
Setup	Description										
0	In running, stall prevention is ineffective										
1	In running, stall prevention is effective										
2	In running, stall prevention is effective										

Code	Name	Default	Description
L3-06	Level of Stall prevention in running	160	<p>Set output current level to start stall function at running</p> <p>Output Frequency</p> <p>Deceleration time</p> <p>Acceleration time</p> <p>Sluggishness 2%</p> <p>(L3-06)</p> <p>Return level</p> <p>Output current Detection time 100ms</p> <p>Under loss protection at running</p>
L4-01	Level of frequency detection	0.0	Frequency detection value of the identical speed (The detection does not include direction of the output frequency)
L4-02	level width of frequency detection	2.0	L4-01 Set level width of frequency detection
L4-03	Level of frequency detection (+/-)	0.0	Frequency detection value of the identical speed (The detection includes direction of the output frequency)
L4-01	Level of frequency detection	0.0	Frequency detection value of the identical speed (The detection does not include direction of the output frequency)

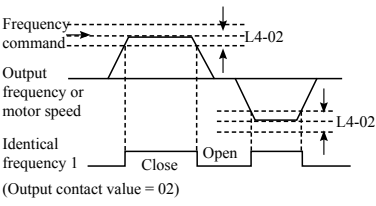

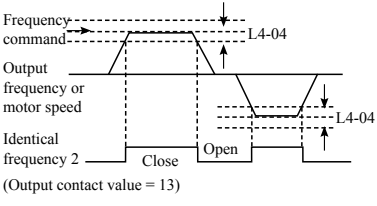

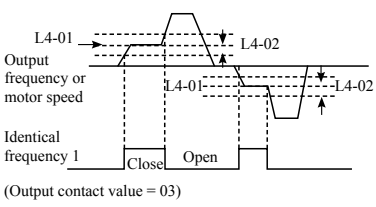

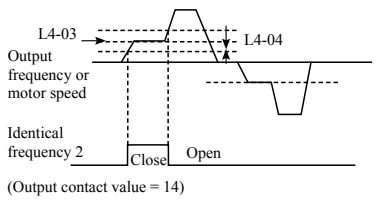

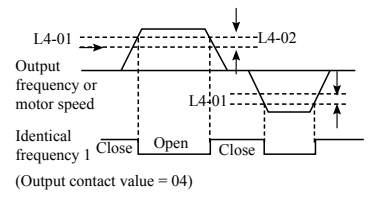

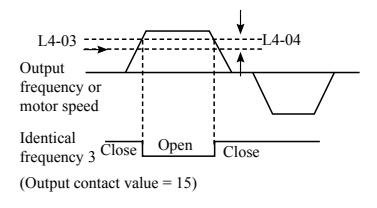

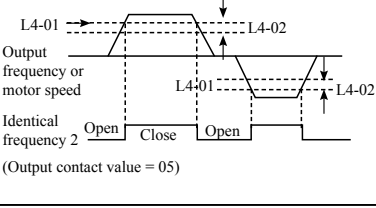

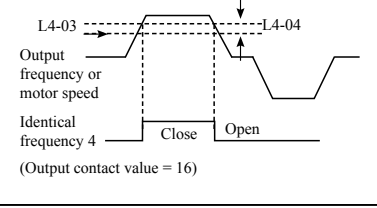

## Chapter 7 Parameters Description

### Description of related frequency detection

(1) Setting value of A1-02 for 1 or 2:

Related	L4-01 (frequency of detection bit quasi-) L4-02 (frequency detection width)	L4-01 (frequency of detection bit quasi-) L4-02 (frequency detection width)
Arrival Frequency	Arrival Frequency1	Arrival Frequency2
	<p>Frequency command</p> <p>Output frequency or motor speed</p> <p>Identical frequency 1</p> <p>Close Open</p> <p>(Output contact value = 02)</p>	<p>Frequency command</p> <p>Output frequency or motor speed</p> <p>Identical frequency 2</p> <p>Close Open</p> <p>(Output contact value = 13)</p>
Random Arrival Frequency	Any Arrival Frequency1	Any Arrival Frequency2
	<p>Output frequency or motor speed</p> <p>Identical frequency 1</p> <p>Close Open</p> <p>(Output contact value = 03)</p>	<p>Output frequency or motor speed</p> <p>Identical frequency 2</p> <p>Close Open</p> <p>(Output contact value = 14)</p>
Frequency detection	Detection frequency1	Detection frequency2
	<p>Output frequency</p> <p>Identical frequency 1</p> <p>Close Open Close</p> <p>(Output contact value = 04)</p>	<p>Output frequency</p> <p>Identical frequency 3</p> <p>Close Open Close</p> <p>(Output contact value = 15)</p>
	Detection frequency3	Detection frequency4
	<p>Output frequency</p> <p>Identical frequency 2</p> <p>Open Close Open</p> <p>(Output contact value = 05)</p>	<p>Output frequency</p> <p>Identical frequency 4</p> <p>Close Open</p> <p>(Output contact value = 16)</p>

(2) Settn value of A1-02 for 3:

Related	L4-01 (frequency of detection bit quasi-) L4-02 (frequency detection width)	L4-01 (frequency of detection bit quasi-) L4-02 (frequency detection width)
Arrival Frequency	<p style="text-align: center;"><b>Arrival Frequency1</b></p>  <p>(Output contact value = 02)</p>	<p style="text-align: center;"><b>Arrival Frequency2</b></p>  <p>(Output contact value = 13)</p>
	<p style="text-align: center;"><b>Any Arrival Frequency1</b></p>  <p>(Output contact value = 03)</p>	<p style="text-align: center;"><b>Any Arrival Frequency2</b></p>  <p>(Output contact value = 14)</p>
Detection frequency	<p style="text-align: center;"><b>Detection frequency1</b></p>  <p>(Output contact value = 04)</p>	<p style="text-align: center;"><b>Detection frequency3</b></p>  <p>(Output contact value = 15)</p>
	<p style="text-align: center;"><b>Detection frequency2</b></p>  <p>(Output contact value = 05)</p>	<p style="text-align: center;"><b>Detection frequency4</b></p>  <p>(Output contact value = 16)</p>

## Chapter 7 Parameters Description

Code	Name	Default	Description						
L4-05	Lost frequency command	0	<p>The dealing option of immediate change from the control terminal</p> <table border="1" style="width: 100%; border-collapse: collapse; margin-top: 10px;"> <thead> <tr> <th style="width: 15%;">Value</th> <th style="width: 85%;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Normal operation (track of command change)</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Frequency command in the control terminals dramatically changes 90% in the 400ms which continues to operate with the fore 80% command.</td> </tr> </tbody> </table>	Value	Description	0	Normal operation (track of command change)	1	Frequency command in the control terminals dramatically changes 90% in the 400ms which continues to operate with the fore 80% command.
Value	Description								
0	Normal operation (track of command change)								
1	Frequency command in the control terminals dramatically changes 90% in the 400ms which continues to operate with the fore 80% command.								
L5-01	Restart number in error	0	<p>Restarting is in getting failed, the inverter will automatically restart for the function of continuing running.</p> <p><b>Abnormal restart</b></p> <ol style="list-style-type: none"> <li>1. In abnormal detection, the drive with a minimum baseblock time (L2-03) output, the manipulator displays abnormality</li> <li>2. As the result of minimum baseblock time, it will automatically restart and the output frequency of speed search function will be carried out</li> <li>3. When the abnormal number is more than restart number, auto restart function will be no longer carried out, the inverter will be interrupted, the contact will take action.</li> </ol> <div style="text-align: center; margin: 10px 0;"> </div> <p>Remove the record in the following circumstances</p> <ol style="list-style-type: none"> <li>1. No abnormality occurs again over 10 minutes</li> <li>2. Input resetting signal to the controller terminals or digital operator.</li> <li>3. The power supply is OFF, and then turns ON.</li> </ol>						

Code	Name	Default	Description															
L5-01	Restart number in error	0	<p>Not carry out the abnormal restart in the following circumstances</p> <table border="1"> <tr> <td>UV2: Low-voltage control loop</td> <td>OPR: Parameter error</td> </tr> <tr> <td>UV3: Main circuit contactor bad</td> <td>CE: Transfer error</td> </tr> <tr> <td>SC: load short-circuit</td> <td>EF3-8: External error</td> </tr> <tr> <td>OH: Overheat</td> <td>ERR: E2PROM error</td> </tr> <tr> <td>EF: Bad command operation</td> <td>SVE: Zero-servo error</td> </tr> <tr> <td>OS: Over speed</td> <td>CF: Control error</td> </tr> <tr> <td>DEV: Speed deviation is too large</td> <td rowspan="2">UV1: main circuit voltage is too low, only in L2-02 = 0</td> </tr> <tr> <td>PGO: PG disconnection</td> </tr> </table>	UV2: Low-voltage control loop	OPR: Parameter error	UV3: Main circuit contactor bad	CE: Transfer error	SC: load short-circuit	EF3-8: External error	OH: Overheat	ERR: E2PROM error	EF: Bad command operation	SVE: Zero-servo error	OS: Over speed	CF: Control error	DEV: Speed deviation is too large	UV1: main circuit voltage is too low, only in L2-02 = 0	PGO: PG disconnection
UV2: Low-voltage control loop	OPR: Parameter error																	
UV3: Main circuit contactor bad	CE: Transfer error																	
SC: load short-circuit	EF3-8: External error																	
OH: Overheat	ERR: E2PROM error																	
EF: Bad command operation	SVE: Zero-servo error																	
OS: Over speed	CF: Control error																	
DEV: Speed deviation is too large	UV1: main circuit voltage is too low, only in L2-02 = 0																	
PGO: PG disconnection																		
L5-02	Contact action of restarting in error	0	<p>Action mode of the contact in the abnormal restart</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>In restart, the abnormal contact does not action</td> </tr> <tr> <td>1</td> <td>In restart, the abnormal contact actions.</td> </tr> </tbody> </table>	Value	Description	0	In restart, the abnormal contact does not action	1	In restart, the abnormal contact actions.									
Value	Description																	
0	In restart, the abnormal contact does not action																	
1	In restart, the abnormal contact actions.																	
L6-01	Over torque detection mode 1	0	<p>Set the function of torque detection:            *In V / F control mode, determined by the output current.            *In vector control mode, standard by the internal torque level of the converter.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Torque detection is effective.</td> </tr> <tr> <td>1</td> <td>Torque detection is effective. The torque will be detected when the speed is reached. The OL3 will flashe and continue running after the detection</td> </tr> <tr> <td>2</td> <td>Operation-torque detection is effective. The torque will be detected at running. The OL3 will flashe and continue running after the detection</td> </tr> <tr> <td>3</td> <td>Torque detection is effective. The torque will be detected when the speed is reached. The OL3 will flashe and continue running after the detection	2	Operation-torque detection is effective. The torque will be detected at running. The OL3 will flashe and continue running after the detection	3	Torque detection is effective. The torque will be detected when the speed is reached. The OL3 will show abnormality and the inverter will be interrupted	4	Torque detection is effective. The torque will be detected at running. The OL3 will show abnormality and the inverter will be interrupted			
Value	Description																	
0	Torque detection is effective.																	
1	Torque detection is effective. The torque will be detected when the speed is reached. The OL3 will flashe and continue running after the detection																	
2	Operation-torque detection is effective. The torque will be detected at running. The OL3 will flashe and continue running after the detection																	
3	Torque detection is effective. The torque will be detected when the speed is reached. The OL3 will show abnormality and the inverter will be interrupted																	
4	Torque detection is effective. The torque will be detected at running. The OL3 will show abnormality and the inverter will be interrupted																	
L6-02	Over torque detection level 1	150	<p>Set torque level detection.            V / F control mode: the inverter rated current to 100%.            Vector control mode: the motor rated torque of 100%.</p>															
L6-03	Over torque detection time1	0.1	<p>The current or torque of the motor is more than the setting value of L6-02 and longer than L6-03, then detected. In the detection, the device displays "OL3"</p>															

## Chapter 7 Parameters Description

Code	Name	Default	Description						
L6-04	Over torque detection mode2	0	The function of L6-04 ~ L6-06 is the same with that of L6-01 ~ L6-3, which is cooperative with the multi-function output terminal, setting "Detection of operation torque 2".When detected, the device displays "OL4".						
L6-05	Over torque detection level 2	150							
L6-06	Over torque detection time2	0.1							
L7-01	Forward torque motor limit	200	Set forward torque motor limit for value						
L7-02	Reverse torque motor limit	200	Set feverse torque motor limit for value						
L7-03	Forward torque revival limit	200	Set forward torque revival limit for value						
L7-04	Reverse torque revival limit	200	<p>Set reverse torque revival limit for value</p> <p style="text-align: center;">Torque command</p> <p>Positive + <span style="float: right;">L7-01</span></p> <p>L7-04 <span style="float: right;">Forward</span></p> <p>Negative - <span style="margin-left: 100px;">0</span></p> <p style="text-align: center;">L7-03</p> <p>L7-02 <span style="margin-left: 100px;">Negative -</span></p>						
L8-01	Built-in protection of braking resistor	0	<p>When the braking resistor is built in the inverter, the protection functional option is overheat.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 15%;">Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">0</td> <td>Overheat protection of Braking resistor is ineffective.</td> </tr> <tr> <td style="text-align: center;">1</td> <td>Overheat protection of Braking resistor is effective.</td> </tr> </tbody> </table>	Value	Description	0	Overheat protection of Braking resistor is ineffective.	1	Overheat protection of Braking resistor is effective.
Value	Description								
0	Overheat protection of Braking resistor is ineffective.								
1	Overheat protection of Braking resistor is effective.								
L8-02	OH alarm level	95	Setting of overheat pre-alarm in the heat sink.						

Code	Name	Default	Description	
L8-03	OH alarm mode	3	The detection mode of overheat pre-alarm in the heat sink.	
			Value	Description
			0	Decelerate to stop according to C1-02.
			1	Free operation
			2	Decelerate to stop according to C1-09. (Rapidly)
3	Continue to run.			
L8-05	Short input phase protection	0	Under short phase of power supply or imbalanced voltage or the electrolytic capacitor is getting bad, over ripple more than the main loop detection of DC frequency will make the inverter stop.	
			Value	Description
			0	Over ripple detection is ineffective.
			1	Over ripple detection is effective.
L8-07	Short output phase protection	0	Detection of short output phase	
			Value	Description
			0	Detection of short output phase is ineffective
			1	Detection of short output phase is effective.
L8-10	Grounding failure	1	Detection of grounding failure	
			Value	Description
			0	Detection of grounding failure is ineffective
			1	Detection of grounding failure effective.
L8-17	Reduce carrier frequency mode	1	Detection of reducing carrier frequency	
			Value	Description
			0	Detection of reducing carrier frequency is ineffective
			1	Detection of reducing carrier frequency effective.
L8-19	OL2 detection mode in low speed	0	Detection of OL2 detection mode in low speed	
			Value	Description
			0	Detection of OL2 detection mode in low speed is ineffective
			1	Detection of OL2 detection mode in low speed effective.

### 7.9 Ogroup parameter

Code	Name	Default	Description										
01-01	Monitor mode	6	There are 4 types of programs at running under monitor instead of U1-04 mode, and used to take place of output voltage display. Setting mode is 01-01 in place of □□ within U1- □□										
01-02	Mode of monitoring project in inputting power	1	<p>Display project when inputting power</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Display frequency command</td> </tr> <tr> <td>2</td> <td>Output frequency command</td> </tr> <tr> <td>3</td> <td>Display output current</td> </tr> <tr> <td>4</td> <td>Display set point 01-01</td> </tr> </tbody> </table>	Value	Description	1	Display frequency command	2	Output frequency command	3	Display output current	4	Display set point 01-01
Value	Description												
1	Display frequency command												
2	Output frequency command												
3	Display output current												
4	Display set point 01-01												
01-03	Frequency command/monitoring setup unit	0	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unit: 0.01HZ</td> </tr> <tr> <td>1</td> <td>Unit: 0.01%</td> </tr> <tr> <td>2~39</td> <td>Unit: r/min Vector control with <math>r/min=120 \times FREQ (HZ) / 01-03</math></td> </tr> <tr> <td>40 ~ 39999</td> <td>The fifth number of 01-03 decides a position of the decimal point.                      The fifth number = 0: presented by □□□□                      The fifth number = 1: presented by □□□.□                      The fifth number = 2: presented by □□.□□                      The fifth number = 3: presented by □.□□□                      From the forth number to the first number of 0.-03 decides the means of 100% frequency value.                      (example one)                      When 01-03=12000 is settled, 100% speed presented by 200.0; 60% speed presented by 120.0.                      (example two)                      When 01-03=26500 is settled, 60% speed presented by 39.00.</td> </tr> </tbody> </table>	Value	Description	0	Unit: 0.01HZ	1	Unit: 0.01%	2~39	Unit: r/min Vector control with $r/min=120 \times FREQ (HZ) / 01-03$	40 ~ 39999	The fifth number of 01-03 decides a position of the decimal point. 01-04	Parameter setup unit	0	<p>Setup unit of V/F related parameter (E1-04, 06, 07, 09) can be changed by the rpm.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Unit: 0.01HZ</td> </tr> <tr> <td>1</td> <td>Unit: rpm</td> </tr> </tbody> </table>	Value	Description	0	Unit: 0.01HZ	1	Unit: rpm				
Value	Description												
0	Unit: 0.01HZ												
1	Unit: rpm												

Code	Name	Default	Description	
01-05	Parameter No. mode	0	The parameter No. on the controller presents option.	
			Value	Description
			0	Usual display (eg. A1-00)
			1	MODBUS displays the address.
02-01	Local/remote button	1	Local / Remote button setting	
			Value	Description
			0	The Local/Remote button is ineffective.
			1	The Local/Remote button is effective.
02-02	Stop button	1	At running , stop button setting	
			Value	Description
			0	Stop button is ineffective.
			1	STOP button is effective.
02-03	Users reset to the initial value	1	Value	
			Description	
			1	02-03 = 1, save initial value of the users. After setting the initial value, and set A1-03 = 1110, all the parameters will be returned to the initial value of the users.
			2	Clear the initial value of the users
02-04	Inverter capacity mode	-	Inverter capacity mode	
02-05	Setting mode of frequency command	0	In inputting the frequency command, whether it is necessary to push Enter key	
			Value	Description
			0	ENTER key - necessary
			1	ENTER key - unnecessary
02-06	Mode of Disconnected manipulator	0	Transmission between the manipulator and the inverter gets abnormal (broken cable or removed manipulator).	
			Value	Description
			0	Inverter continues to operate
			1	Decelerate to stop and the alarm message display "OPR"
02-07	Setting of accumulative working time	-	accumulate working time	
02-08	Mode of accumulative working time	0	Value	
			Description	
			0	When Power is supplying to the inverter, accumulate the working time.
			1	When Inverter is running, accumulate working time.

## Chapter 7 Parameters Description

### Setup List of Multi-Functional Input / Output Terminals

\*\*H3-09 is set 1F as effectiveness

Setup	Multi-functional input (H1-01, 02,03,04,05,06)	Multi-functional output (H2-01, 02,03)	Multi-functional analog input (H3-05)
00	3 phase control mode	Running	Auxiliary frequency command
01	Local/Remote mode	Zero Speed	FGAIN
02	Option cards / switched by inverter	Frequency1	FBIAS
03	Multi-speed command1	Random arrival frequency1	Reserved
04	Multi-speed command2	Frequency detection 1	VBIAS
05	Multi-speed command3	Frequency detection 2	Speed up/down Coefficient
06	Jog	Ready	DC braking current
07	Time mode of acceleration and deceleration 1	Detecting low voltage	Over torque detection level
08	External b.b (A contact point)	In b.b (A contact point)	Stall level in running
09	External b.b (a contact)	Frequency command mode	Frequency command minimum level
0A	Speed down to stop	Operation command mode	Frequency prohibition number
0B	Overheating warning (OH2)	In torque detection	PID feedback
0C	Multi-function analog input	Loss frequency command	Reserved
0D	Cancel speed control	Bad connection of brake resistor	
0E	Reset speed control integral value	Abnormality	
0F	Reserved	Reserved	
10	Acceleration contact (UP)	Alarm	Forward torque limit
11	Deceleration contact (DOWN)	In abnormality return	Reverse torque limit
12	Jog forward	Timer output	retro gradation limit
13	Jog reverse	Arrival frequency 2	torque command, torque limit
14	Abnormality reset	Random arrival frequency 2	Torque compensation

Setup	Multi-functional input (H1-01, 02,03,04,05,06)	Multi-functional output (H2-01, 02,03)	Multi-functional analog input (H3-05)		
15	Emergency stop	Frequency detection 3	Forward / reverse torque limits		
16	Reserved	Frequency detection 4	Reserved		
17	Reserved	Detecting torque 1 (B contact)			
18	Timer input	Detecting torque 2 (A contact)			
19	Cancel PID control	Detecting torque 3 (B contact)			
1A	Time mode of acceleration and deceleration 2	Reversed			
1B	Argument against writing	In b.b (B contact)			
1C	+SPEED command	Reserved			
1D	-SPEED command	Motor / generator mode			
1E	Analog input sample / hold	Abnormality restart			
1F	**Analog input terminal (13/14)	OL1 Alarm			
20	External abnormality	OH Alarm			
21-2F		Reserved			
30	PID integral return	In torque limit			
Setup	Multi-functional input 3-8 Function mode (H1-01. 02. 03. 04. 05. 06)	Multi-functional output 9.25-26 Function mode (H2-01. 02. 03)		Multi-functional analog input 16 Function mode (H3-05)	
31	Reserved	In speed limit	Reserved		
32		Reserved			
33		Zero-servo completion			
37		Running 2			
34-5F		Reserved		Reserved	
60					DC-braking command
61					External search command 1
62					External search command 2
63					Energy saving running
64					External search command 3

## Chapter 7 Parameters Description

Setup	Multi-functional input (H1-01, 02,03,04,05,06)	Multi-functional output (H2-01, 02,03)	Multi-functional analog input (H3-05)
65	Operation command of instantaneous deceleration to stop (A contact point)	Reserved	Reserved
66	Operation command of instantaneous deceleration to stop (B contact point)		
67-70	Reserved		
71	Switch of speed control/torque control		
72	Zero Servo command		
73-76	Reserved		
77	Switch of speed control/ ratio gain		
78-FF	Reserved		

## 8 Fault Diagnosis and Solution

Error Display	Name	Description	Solution	Level
UV1 Undervoltage fault (puv)	Power under Voltage	While main DC circuit voltage in running lower than" low voltage detect level 15ms"(Instant stop protection 2S) low voltage detect level: 220V class: under 190V 440V class: under 380V	Check power supply voltage, and accessories Check if the capacity of voltage and power supply systems operates properly or not.	A
UV2 Undervoltage fault (cuv)	Control Under Voltage	The control circuit voltage lower than the low voltage detection level		A
UV3 Undervoltage fault (ms-ansfault)	Internal fault of magnetic wiring	Open loop of main circuit of contactor in running		A
UV Momentary power loes	Immediate power outage	DC main loop voltage is lower than the low voltage detection level. The main circuit connects with open loop. The control circuit voltage is lower than low voltage detection level		B
Oc Overcurrent (OC)	Over current (OC)	Output current of the inverter beyond OC level	Check if impedance and insulation of the motor is normal. Prolong the acceleration and deceleration time.	A

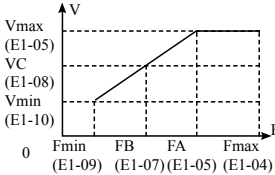

## Chapter 8 Fault Diagnosis and Solution

Error Display	Name	Description	Solution	Level
GF Grounding (GF)	Ground Fault (OF)	Output ground current of the inverter higher than 50% of the rated current.	Check if insulation of the motor is normal. Check if the wiring is broken between Frequency inverter and motor.	A
OV Overvoltage (OV)	Overvoltage (OV)	The main DC circuit voltage higher than the low voltage detect level 200V: about 400V; 400V Class: about 800V	To extend the deceleration time, strengthen the brake resistor and braking controller	A
SC	Short-circuit (SC)	The inverter output is short-circuit	Check whether the motor of impedance and insulation is normal or not.	A
PUF	Fuse broken wire (PU)	The main circuit transistor module Error DC circuit fuse melts	Check the load of the fuse and whether there are situations such as short circuit, grounding	A
OH Motor overheat (OHI)	Radiator overheat (OH1)	The transistor modules cooling board temperature exceeds the allowance.	Check whether the ambient temperature is within the rated temperature	A
OLI Motor overload (OLI)	Motor overload (OL1)	Output current over the motor speed limited.	Reduce the load capacity	A
OL2 Inverter overload (OL2)	Inverter overload (OL2)	The output current of inverter exceeds the 150% of rated current	Reduce the load and the acceleration time	A
OL3 Overtorque det1	Over torque 1	When the torque or current value over the setting value of L6-02, please set up as L6-01 standard through the setting time of L6-03	Reduce the load	A/B
OL2 Overtorque det 2	Over torque 2	When the torque or current value over the setting value of L6-05, please set up as L6-01 standard over the setting time of L6-03	Reduce the load	A/B
RR Braking transistor fault	Braking transistor fault	Braking transistor fault	Repair converter	A

Error Display	Name	Description	Solution	Level
RH Braking resistor unit overheat	Braking resistor unit overheat	Braking resistor overheat	Revise the time and frequency of the braking resistor braking	A
OS Over speed (OS)	Over speed	The speed of motor over the speed limited (F1-08)		A
PGO PG disconnection (PGO)	PG disconnection	PG connection short-circuit	Check PG connection, check whether the motor shaft blocked	A
DEV Excessive speed deviation (DEV)	Excessive speed deviation	The speed command and speed feedback is over the deviation of the speed bias-bit quasi-(F1-10)	Check whether the overload	B
EF Operation reference fault	Operation reference fault	Forward operation and reverse operation command exist more than 0.5 seconds	Control of timing checks, positive inversion instruction does not exist	B
EFO	external abnormal signal	From the selection of cards to send to external abnormal signal, inverter, according to F9-03 set by the action	Check to send cards, the signal	B
EF3~EF8 External terminal 3 external fault	External terminal 3 external fault	Input abnormal signal of the external terminal 3 ~ 8	from U1-10 to confirm abnormal signal input terminal. According to the abnormality of the terminal to repair	A
OPE 01 KVA selection fault	KVA selection fault	Set converter parameters (02-04) badly	Adjust the setup	C
OPE 02 Constant setting range fault	Constant setting range fault	Parameter setup are beyond the setting value	Adjust the setup	C
OPE 03 Multifunction input selection fault	Multifunction input selection fault	The order of H1-01 ~ 06 is not in order from small to large or set repeated.	Adjust the setup	C
OPE 05 Sequence Select	OPE command card set inappropriately	When B1-01, 02 is set to 3, the communication card is not installed	Adjust the B1-01, -02 or install the communication card	C

## Chapter 8 Fault Diagnosis and Solution

Error Display	Name	Description	Solution	Level
OPE 06 PG Opt Missing	The mode selected inappropriately	when A1-02 is set to 1.3, the feedback card is not installed	Adjust the settings or install feedback cards	C
OPE 07 Analog Selection	The option of Multi-functional analog input inappropriately	H3-05.09 setted to the same value After installing the analog inputting card and F2.01 = 0, the converter does not receive frequency command.	Adjust the frequency settings Check the wiring of the analog input card	C
OPE08	The option of multi-functional inappropriately	1 Select the parameterst unable to use F4-01, 02, FS-01, 02 2. Select the controlling mode H1-01 ~ 06, HS-01 ~ 03.H3-05, 09 H4-01, 04, but not the parameters. 3. Select 01-01 control mode, but not the parameters.	Reset parameters	D
OPE 10 V/F Pattern setting	V/F parameter inappropriete	E1-04~10 must meet the following conditions $F_{max} \geq F_A \geq F_B \geq F_{min}$ (E1-04)) (E1-06) ( E1-07) (E1-09) 	Adjust the settings	C
OPE 11 CarrFrq/ON-Delay	Parameter inappropriete	① Setting Parameter C6-01 >5KHZ but C6-02 ≤ 5KHZ ② C6-03 >6 but C6-02 > C6-01	Adjust the settings	C
CPF 00 Control circuit fault 1	Control circuit fault 1	After inputting the power, the wire between the manipulator and the control panel is abnormal in 5 minutes	Re-install digital manipulator Check control circuit wiring	A

Error Display	Name	Description	Solution	Level
CPF 01 Control circuit fault 2	Control circuit fault 2	Error of MPU Peripheral Components	Replacement control panel	A
CPF 02 Control circuit fault	Base block (BB) bad loop	Error of the inverter control panel	Replacement Control Panel	A
CPF 03 NV-RAM (S-RAM) fault	EEPROM bad			
CPF 04 Constant destruction	Internal A / D converter of CPU bad			
CPF 05 A/D converter fault in CPU	External A / D converter of CPU bad			
CPF 06 Option connection fault	The connection around the interface is bad	The installation of the interface is not correct.	Peripheral adapter re-install	A
CPF 20 A/D converter fault	A / D converter of the analog command card is bad	Analog input card, A / D converter adverse action	Replace analog input card	A
CPF21	Self-diagnosis of send-cards is abnormal.	Error of selective card	Seven new ones	A
CPF22	Models yards of send-card are abnormal			
CPF23	Mutual Diagnosis of cards are abnormal			
CF	Controlling abnormal	When the vector control mode operates without PG, the torque limit can continue for more than 3 consecutive seconds in deceleration to stop	Whether Motor parameters is right	A

## Chapter 8 Fault Diagnosis and Solution

Error Display	Name	Description	Solution	Level
PF	Due phase input	The input power of converter is due phase Input voltage is unbalanced in three phase	Check power supply voltage is normal Check whether the input endpoint screws tightened	A
LF Open-phase load (LF)	Due phase output	The output power of the converter is due phase.	Check out whether the endpoint of the screws and the wiring is normal Check three-phase motor resistance	A
OPR Open Disconnect	Manipulator connecting bad	Operators, in the operation, disconnect.	Check the operation of the wiring devices	A
SVE	Zero Servo abnormal	In the operation of zero servo, the PG values of the motor is more than 10,000 times	Set the size of the torque limit The load torque is too large Check PG signal is affected by noise interference	A
ERR EEPROM writing fault (ERR)	Bad input EEPROM	When the parameters initialize, the correct information can not be input. EEPROM	Switch controller	B
CALL SI-B transmission error	Errors of SI-B transmission	When the power inputs, the controlling signal is abnormal	Re-examine the transferring machine control signal	C
CE	Transmission Error	After transmitting the signal in 2 seconds, the normal response signal isn't received.	Re-examine the transferring machine control signal	A
BUS	Transmission Fault	The setting mode operation command and frequency setting from the transmitting card is failure.	Check the transferring card and signal	A

### Grade the fault level

A: Serious error. The motor stops naturally. The error displays the digital manipulator and the abnormal contact outputs 18, 20 connected.

B: Light error. The motor continues to operate. The error displays the digital manipulator and the abnormal connect doesn't work, multi-functional output works.

C: Warning, the converter doesn't work. he error displays the digital manipulator and the abnormally multi- functional connect doesn't work

## Discrepancy of VG5 & VG2 model and Description of the accessories

Discrepancy of VG5 and VG2		
Model	VG2	VG5
Model Discrepancy	120% 1 min of overload Without close-loop control function Without communication	150% 1 min of overload With close-loop control function With communication
Parameter Discrepancy	V/F mode: Without parameter B7, B9, C5, C8, D5, F1, L7 Without PG mode: Without B7, B8, B9, C5, D5, F1	All the parameter can be used

Code	Function
SI-K2	RS485/232 Card
SI-P1	Profibus Card
PG-B2	PG Feedback Card with 12V Push Pull
PG-X2	PG Feed back Card with 5V Lin Drive
Voltage/Current transformation Card	

### VG5 installation description

Capacity KVA	6.1	11	14	21	26	37	50	61	73	98	130	140	170	230	260	340	430	460	490	519
Related Current A	8	14	18	27	34	48	65	80	96	128	165	180	224	302	340	450	530	605	695	788
Maximum output voltage	Three Phase 200/208/220/230V (Corresponding to input power)																			
Rated output frequency	setting Parameter to 400Hz																			
voltage/ Frequency	three phase 200/208/220/230V 50/60Hz																			
Allowed voltage changes	-10%, -15%																			
Allowed frequency changes	±5%																			
Control mode	control by vector magnetic beam, positive wave PWM																			
Starting torque	150%/1Hz(150%/or/min to PG)																			
Speed control	1:100(1:1000 to PG)																			
Control precision	±0.2%(±0.02% to PG)																			
Speed of change	5Hz(30Hz to PG)																			
Torque limit	parameter setting 4 models																			
Torque Accuracy	±5%																			
Torque change	20Hz (40Hz up to PG)																			

Series	VG2 / VG5																				
	Model	21P5	22P2	23P7	25P5	27P5	2011	2015	2018	2022	2030	2037	2045	2055	2075	2090	2110	2132	2160	2185	2200
Frequency control range	0.1 ~ 400Hz																				
Frequency precision	Digital command: $\pm 0.01\%$ ( $-10^{\circ}\text{C} \sim 40^{\circ}\text{C}$ ) Analog commands: $\pm 0.1\%$ ( $25^{\circ}\text{C} \pm 10^{\circ}\text{C}$ )																				
Frequency Analysis	Digital operation of disk commands: $\pm 0.01\text{Hz}$ Analog command: $\pm 0.03\text{Hz}/60\text{Hz}$ (11bit - code)																				
Output Frequency Resolution	0.01Hz																				
Overload	Rated torque 150% / 1 minute																				
Frequency setting signal	$-10 \sim 10\text{V}$ , $0 \sim 10\text{V}$ (20K $\Omega$ ), $4 \sim 20\text{mA}$																				
Acceleration and deceleration time	0.01 to 6000.0 seconds (the time of acceleration, deceleration is independent, four kinds of timing for option)																				
Brake Torque	20% (with brake resistor to 150%)																				
Voltage / frequency characteristics	15 types of fixed V / F characteristics can be chosen and arbitrary V / F characteristic is set																				
Motor overload protection	protection by electronic integrable thermoelectric relay																				
Transient overvoltage 200%	When the related output current is 200%, the motor stops naturally.																				
Fuse fuse protection	The operation of the motor stops naturally.																				
Overload	When the related output current is 150% per minute, the motor stops naturally( If it's 150% / 2 minutes, it can be ordered)																				
Overvoltage	Stop when the main loop voltage is over 410V																				
Insufficient voltage	Stop when the main loop voltage is below 190V																				
Control Characteristics											protection function										

Series		VG2 / VG5																				
Model		21P5	22P2	23P7	25P5	27P5	2011	2015	2018	2022	2030	2037	2045	2055	2075	2090	2110	2132	2160	2185	2200	
Instantaneous power failure compensation	protection function	The selection of the operation mode, about within 2sec the power failure, return 0, continuing to operate.																				
Heatsink overheat		Protect by the temperature switch																				
Stall Prevention		In the acceleration and deceleration, prevent the loss of the speed.																				
Ground Fault		In the acceleration and deceleration, prevent the loss of the speed.																				
Charging protection		The main circuit won't display when DC voltage is below 50V .																				
Ambient temperature		-10 °C ~ +40 °C (atresia-wall type) C20:Q21+C43 -10 °C ~ +45 °C (in-tray to take payment type)																				
Humidity		below 90%RH																				
Storage Temperature		-20°C ~ +60°C																				
The use of premises		Housing estates (non-corrosive gases)																				
Elevation		below 1000M																				
Vibration		20Hz insufficient 9.8m/s2(0.2G)
